From Theoretical Results to Real-World Applications in Bonds, FX, Commodities and Cryptocurrencies: An Overview on Market Making Models

Pr. Olivier Guéant

22nd Winter School on Mathematical Finance - Jan. 2025

▲□▶ ▲□▶ ▲三▶ ▲三▶ 三 少へ⊙

4 □ ▶ 4 同 ▶ 4 Ξ ▶ 4 Ξ ▶

Market makers

 Activity: providing bid and ask/offer prices to other market participants.

4 □ ▶ 4 同 ▶ 4 Ξ ▶ 4 Ξ ▶

- Activity: providing bid and ask/offer prices to other market participants.
- The way they make money: capturing part of the bid-ask spreads.

4 □ ▶ 4 周 ▶ 4 Ξ ▶ 4 Ξ ▶

- Activity: providing bid and ask/offer prices to other market participants.
- The way they make money: capturing part of the bid-ask spreads.
- Risks:

・ロト ・ 一下・ ・ ヨト

- Activity: providing bid and ask/offer prices to other market participants.
- The way they make money: capturing part of the bid-ask spreads.
- Risks:
 - Holding inventory

< □ ト < 同 ト < 三 ト < 三 ト</p>

Market makers

- Activity: providing bid and ask/offer prices to other market participants.
- The way they make money: capturing part of the bid-ask spreads.
- Risks:
 - Holding inventory

 \rightarrow face the risk that prices move adversely without them being able to unwind their position.

< □ ト < 同 ト < 三 ト < 三 ト</p>

Market makers

- Activity: providing bid and ask/offer prices to other market participants.
- The way they make money: capturing part of the bid-ask spreads.
- Risks:
 - Holding inventory

 \rightarrow face the risk that prices move adversely without them being able to unwind their position.

Information asymmetry / adverse selection by informed traders

< □ ト < 同 ト < 三 ト < 三 ト</p>

Market makers

- Activity: providing bid and ask/offer prices to other market participants.
- The way they make money: capturing part of the bid-ask spreads.
- Risks:
 - Holding inventory

 \rightarrow face the risk that prices move adversely without them being able to unwind their position.

Information asymmetry / adverse selection by informed traders
 → face the risk of buying / selling when the price will go down / up.

Market makers

- Activity: providing bid and ask/offer prices to other market participants.
- The way they make money: capturing part of the bid-ask spreads.
- Risks:
 - Holding inventory

 \rightarrow face the risk that prices move adversely without them being able to unwind their position.

• Information asymmetry / adverse selection by informed traders \rightarrow face the risk of buying / selling when the price will go down / up.

Remark: I mainly focused on market making in OTC markets. Not market making in limit order books (no tick size, no queue, no priority).

One asset: reference price process ("mid"-price) $(S_t)_t$

Brownian dynamics

 $dS_t = \sigma dW_t$.

 \rightarrow Can be the CBBT / CP+ for corporate bonds or a homemade reference price.

 \rightarrow Can be EBS / Refinitiv mid price or a homemade composite.

Setup of the model (II)

・ロト ・ 一 ト ・ ヨ ト ・ コ ト

Bid and ask prices proposed by the MM

$$S_t^b = S_t - \delta_t^b$$
 and $S_t^a = S_t + \delta_t^a$.

Setup of the model (II)

Bid and ask prices proposed by the MM

$$S_t^b = S_t - \delta_t^b$$
 and $S_t^a = S_t + \delta_t^a$.

Dynamics of the inventory $(q_t)_t$

$$dq_t = \Delta dN_t^b - \Delta dN_t^a,$$

for two point processes N^b and N^a .

Setup of the model (II)

Sac

Bid and ask prices proposed by the MM

$$S_t^b = S_t - \delta_t^b$$
 and $S_t^a = S_t + \delta_t^a$.

Dynamics of the inventory $(q_t)_t$

$$dq_t = \Delta dN_t^b - \Delta dN_t^a,$$

for two point processes N^b and N^a .

Competition and demand are modeled indirecty through the probability / intensity of jumps.

Setup of the model (III)

Intensities $(\lambda_t^b)_t$ and $(\lambda_t^a)_t$ of N^b and N^a

 $\lambda_t^b = \Lambda^b(\delta_t^b) \mathbf{1}_{q_t - <Q} \text{ and } \lambda_t^a = \Lambda^a(\delta_t^a) \mathbf{1}_{q_t - >-Q}.$

They depend on the distance to the reference price: Λ^b , Λ^a decreasing (of course!)

Setup of the model (III)

▲□▶ ▲□▶ ▲ ■▶ ▲

Sac

Intensities $(\lambda_t^b)_t$ and $(\lambda_t^a)_t$ of N^b and N^a

$$\lambda^b_t = \Lambda^b(\delta^b_t) 1_{q_{t-} < Q} \text{ and } \lambda^a_t = \Lambda^a(\delta^a_t) 1_{q_{t-} > -Q}.$$

They depend on the distance to the reference price: Λ^{b} , Λ^{a} decreasing (of course!)

Cash process $(X_t)_t$

 $dX_t = \Delta S_t^a dN_t^a - \Delta S_t^b dN_t^b = -S_t dq_t + \delta_t^a \Delta dN_t^a + \delta_t^b \Delta dN_t^b.$

Setup of the model (III)

Intensities $(\lambda_t^b)_t$ and $(\lambda_t^a)_t$ of N^b and N^a

$$\lambda^b_t = \Lambda^b(\delta^b_t) 1_{q_{t-} < Q} \text{ and } \lambda^a_t = \Lambda^a(\delta^a_t) 1_{q_{t-} > -Q}.$$

They depend on the distance to the reference price: Λ^{b} , Λ^{a} decreasing (of course!)

Cash process $(X_t)_t$

$$dX_t = \Delta S_t^a dN_t^a - \Delta S_t^b dN_t^b = -S_t dq_t + \delta_t^a \Delta dN_t^a + \delta_t^b \Delta dN_t^b.$$

Three state variables: X (cash), q (inventory), and S (price).

PnL and objective function

▲□▶ ▲ □ ▶ ▲ □ ▶

PnL at time T of a market maker

$$PnL_{T} = X_{T} + q_{T}S_{T} = X_{0} + q_{0}S_{0}$$
$$+ \int_{0}^{T} \underbrace{\delta_{t}^{a}\Delta dN_{t}^{a} + \delta_{t}^{b}\Delta dN_{t}^{b}}_{\text{spread capture}} + \underbrace{\sigma q_{t}dW_{t}}_{\text{inventory+price risk}}$$

PnL and objective function

PnL at time T of a market maker

$$PnL_{T} = X_{T} + q_{T}S_{T} = X_{0} + q_{0}S_{0}$$
$$+ \int_{0}^{T} \underbrace{\delta_{t}^{a}\Delta dN_{t}^{a} + \delta_{t}^{b}\Delta dN_{t}^{b}}_{\text{spread capture}} + \underbrace{\sigma q_{t}dW_{t}}_{\text{inventory+price risk}}$$

The original Avellaneda-Stoikov's model considers a CARA utility (Model A):

CARA objective function

$$\sup_{\delta_t^a)_t, (\delta_t^b)_t \in \mathcal{A}} \mathbb{E}\left[-\exp\left(-\gamma (X_T + q_T S_T)\right)\right],$$

where γ is the absolute risk aversion parameter, and A the set of predictable processes bounded from below.

|□▶▲母▶▲≧▶▲≧▶ ≧ めへで

HJB equation

<u>▲□▶▲</u>@▶**▲**≣▶**4**≣▶ ≣ りゅつ

HJB equation

In what follows, u is a candidate for the value function.

Hamilton-Jacobi-Bellman

(HJB)
$$0 = \partial_t u(t, x, q, S) + \frac{1}{2} \sigma^2 \partial_{SS}^2 u(t, x, q, S)$$
$$+ \mathbf{1}_{q < Q} \sup_{\delta^b} \Lambda^b(\delta^b) \left[u(t, x - \Delta S + \Delta \delta^b, q + \Delta, S) - u(t, x, q, S) \right]$$
$$+ \mathbf{1}_{q > -Q} \sup_{\delta^a} \Lambda^a(\delta^a) \left[u(t, x + \Delta S + \Delta \delta^a, q - \Delta, S) - u(t, x, q, S) \right]$$

with final condition:

$$u(T, x, q, S) = -\exp\left(-\gamma(x+qS)\right)$$

Change of variables

▲□▶▲□▶▲壹▶▲壹▶ 壹 少९0

Change of variables

Ansatz

$$u(t, x, q, S) = -\exp(-\gamma(x + qS + \theta(t, q)))$$

Change of variables

Ansatz

$$u(t, x, q, S) = -\exp(-\gamma(x + qS + \theta(t, q)))$$

New equation

$$0=\partial_t heta(t,q)-rac{1}{2}\gamma\sigma^2q^2$$

$$+ \mathbf{1}_{q < Q} \sup_{\delta^{b}} \frac{\Lambda^{b}(\delta^{b})}{\gamma} \left(1 - \exp\left(-\gamma \left(\Delta \delta^{b} + \theta(t, q + \Delta) - \theta(t, q)\right)\right) \right)$$

$$+1_{q>-Q} \sup_{\delta^a} rac{ \Lambda^a(\delta^a)}{\gamma} \left(1- \exp\left(-\gamma \left(\Delta \delta^a + heta(t,q-\Delta) - heta(t,q)
ight)
ight)$$

with final condition $\theta(T, q) = 0$.

Equation for θ

▲□▶ ▲□▶ ▲ 三▶ ▲

A new transform

$$egin{aligned} & H^b_{\xi}(p) = \sup_{\delta} rac{\Lambda^b(\delta)}{\xi\Delta} \left(1 - \exp\left(-\xi\Delta\left(\delta - p
ight)

The functions H^b_{ξ} and H^a_{ξ}

< □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶ < □ ▶

Proposition

- $\forall \xi \ge 0$, $H_{\xi}^{b/a}$ is a decreasing function of class C^2 .
- In the definition of $H_{\xi}^{b/a}(p)$, the supremum is attained at a unique $\tilde{\delta}_{\xi}^{b/a*}(p)$ characterized by

$$ilde{\delta}^{b/a*}_{\xi}(p) = {\Lambda^{b/a}}^{-1} \left(\xi \Delta H^{b/a}_{\xi}(p) - H^{b/a'}_{\xi}(p)
ight).$$

• The function $p \mapsto \tilde{\delta}_{\xi}^{b/a*}(p)$ is increasing.

Existence and uniqueness

▲□▶ ▲圖▶ ▲ 三▶ ▲ 三 り Q C

Existence and uniqueness

Results for θ

There exists a unique C^1 (in time) solution $t \mapsto (\theta(t,q))_{|q| \leq Q}$ to

$$egin{aligned} 0 &= \partial_t heta(t,q) - rac{1}{2} \gamma \sigma^2 q^2 + \mathbbm{1}_{q < Q} \Delta \mathcal{H}^b_{\xi} \left(rac{ heta(t,q) - heta(t,q+\Delta)}{\Delta}
ight) \ &+ \mathbbm{1}_{q > -Q} \Delta \mathcal{H}^a_{\xi} \left(rac{ heta(t,q) - heta(t,q-\Delta)}{\Delta}
ight) \end{aligned}$$

with final condition $\theta(T,q) = 0$.

Solution of the initial problem (verification argument)

▲□▶▲□▶▲三▶▲三▶ ▲□▶

Solution of the initial problem (verification argument)

By using a verification argument, the function u is the value function associated with the problem.

Optimal quotes

The optimal quotes in models A ($\xi = \gamma$) and B ($\xi = 0$) are:

$$egin{aligned} \delta^{b*}_t &= ilde{\delta}^{b*}_{\xi} \left(rac{ heta(t,q_{t-}) - heta(t,q_{t-} + \Delta)}{\Delta}
ight) \ \delta^{a*}_t &= ilde{\delta}^{a*}_{\xi} \left(rac{ heta(t,q_{t-}) - heta(t,q_{t-} - \Delta)}{\Delta}
ight) \end{aligned}$$

where

$$ilde{\delta}^{b/a*}_{\xi}(p) = {\Lambda^{b/a}}^{-1}\left(\xi\Delta H^{b/a}_{\xi}(p) - H^{b/a'}_{\xi}(p)
ight).$$

The case
$$\Lambda^b(\delta) = \Lambda^a(\delta) = Ae^{-k\delta}$$
 (I)

The functions $H^{b/a}_{\xi}$ and $\tilde{\delta}^{b/a*}_{\xi}$

If $\Lambda^{b}(\delta) = \Lambda^{a}(\delta) = Ae^{-k\delta}$, then $H_{\xi}^{b/a}(p) = \frac{A}{k}C_{\xi}\exp(-kp)$, with

$$\mathcal{C}_{\xi} = egin{cases} \left(1+rac{\xi\Delta}{k}
ight)^{-rac{k}{\xi\Delta}-1} & ext{if } \xi > 0 \ e^{-1} & ext{if } \xi = 0 \end{cases}$$

and

$$ilde{\delta}^{b/a*}_{\xi}(p) = egin{cases} p+rac{1}{\xi\Delta}\log\left(1+rac{\xi\Delta}{k}
ight) & ext{if } \xi>0 \ p+rac{1}{k} & ext{if } \xi=0, \end{cases}$$

The case
$$\Lambda^{b}(\delta) = \Lambda^{a}(\delta) = Ae^{-k\delta}$$
 (II)

The system of ODEs

$$egin{aligned} 0 &= \partial_t heta(t,q) - rac{1}{2} \gamma \sigma^2 q^2 + \ &+ rac{A\Delta}{k} C_\xi \left(1_{q < Q} e^{k rac{ heta(t,q+\Delta) - heta(t,q)}{\Delta}} + 1_{q > -Q} e^{k rac{ heta(t,q-\Delta) - heta(t,q)}{\Delta}}
ight), \end{aligned}$$

<ロト < 四ト < 三ト < 三ト</p>

with final condition $\theta(T, q) = 0$.

The case
$$\Lambda^b(\delta) = \Lambda^a(\delta) = Ae^{-k\delta}$$
 (II)

The system of ODEs

$$\begin{split} 0 &= \partial_t \theta(t,q) - \frac{1}{2} \gamma \sigma^2 q^2 + \\ &+ \frac{A\Delta}{k} C_{\xi} \left(\mathbf{1}_{q < Q} e^{k \frac{\theta(t,q+\Delta) - \theta(t,q)}{\Delta}} + \mathbf{1}_{q > -Q} e^{k \frac{\theta(t,q-\Delta) - \theta(t,q)}{\Delta}} \right), \end{split}$$

with final condition $\theta(T, q) = 0$.

Change of variables:
$$v_q(t) = \exp\left(rac{k heta(t,q)}{\Delta}
ight)$$

▲□▶ ▲□▶ ▲三▶ ▲三▶ 三 りへぐ

The case
$$\Lambda^b(\delta)=\Lambda^a(\delta)=Ae^{-k\delta}$$
 (III)

A linear system of ODEs

$$\mathbf{v}_{q}'(t) = lpha q^{2} \mathbf{v}_{q}(t) - \eta_{\xi} \left(\mathbf{1}_{q < Q} \mathbf{v}_{q+\Delta}(t) + \mathbf{1}_{q > -Q} \mathbf{v}_{q-\Delta}(t)
ight),$$

with

$$\alpha = \frac{k}{2\Delta} \gamma \sigma^2, \qquad \eta_{\xi} = AC_{\xi}$$

< □ ▶

þ

and the terminal condition v(T, q) = 1.

The case
$$\Lambda^b(\delta)=\Lambda^a(\delta)=Ae^{-k\delta}$$
 (III)

A linear system of ODEs

$$v_q'(t) = \alpha q^2 v_q(t) - \eta_{\xi} \left(\mathbf{1}_{q < Q} v_{q+\Delta}(t) + \mathbf{1}_{q > -Q} v_{q-\Delta}(t) \right),$$

with

$$\alpha = \frac{k}{2\Delta}\gamma\sigma^2, \qquad \eta_{\xi} = AC_{\xi}$$

and the terminal condition v(T,q) = 1.

This simplifies a lot the equations of Avellaneda and Stoikov. See the paper Guéant-Lehalle-Fernandez-Tapia (2013) (when $\Delta = 1$ and $\xi = \gamma$).

500

The case
$$\Lambda^b(\delta)=\Lambda^a(\delta)=Ae^{-k\delta}$$
 (IV)

Optimal quotes

The optimal quotes in models A ($\xi = \gamma$) and B ($\xi = 0$) are:

$$egin{aligned} \delta^{b*}_t &= \delta^{b*}(t,q_{t-}) \coloneqq D_{\xi} + rac{1}{k} \ln\left(rac{v_{q_{t-}}(t)}{v_{q_{t-}+\Delta}(t)}
ight) \ \delta^{a*}_t &= \delta^{a*}(t,q_{t-}) \coloneqq D_{\xi} + rac{1}{k} \ln\left(rac{v_{q_{t-}}(t)}{v_{q_{t-}-\Delta}(t)}
ight) \ D_{\xi} &= egin{cases} rac{1}{\xi\Delta} \log\left(1 + rac{\xi\Delta}{k}
ight) & ext{if } \xi > 0 \ rac{1}{\xi} & ext{if } \xi = 0, \end{aligned}$$

< □ ▶

The case
$$\Lambda^b(\delta)=\Lambda^a(\delta)=Ae^{-k\delta}$$
 (IV)

Optimal quotes

The optimal quotes in models A ($\xi = \gamma$) and B ($\xi = 0$) are:

$$egin{aligned} \delta^{b*}_t &= \delta^{b*}(t,q_{t-}) \coloneqq D_{\xi} + rac{1}{k} \ln\left(rac{v_{q_{t-}}(t)}{v_{q_{t-}+\Delta}(t)}
ight) \ \delta^{a*}_t &= \delta^{a*}(t,q_{t-}) \coloneqq D_{\xi} + rac{1}{k} \ln\left(rac{v_{q_{t-}}(t)}{v_{q_{t-}-\Delta}(t)}
ight) \ D_{\xi} &= egin{cases} rac{1}{\xi\Delta} \log\left(1 + rac{\xi\Delta}{k}
ight) & ext{if } \xi > 0 \ rac{1}{\xi} & ext{if } \xi = 0, \end{aligned}$$

The optimal quotes are made of two components:

• D_{ξ} corresponds to the static trade-off.

•
$$\frac{1}{k} \ln \left(\frac{v_q(t)}{v_{q+\Delta}(t)} \right)$$
 or $\frac{1}{k} \ln \left(\frac{v_q(t)}{v_{q-\Delta}(t)} \right)$: dynamic aspects.

The case
$$\Lambda^b(\delta)=\Lambda^a(\delta)=Ae^{-k\delta}$$
 (V)

The optimal quote functions far from T only depend on q:

Asymptotics

$$egin{aligned} &\delta^{b*}_\infty(q) = \lim_{T o\infty} \delta^{b*}(0,q) = D_\xi + rac{1}{k} \ln\left(rac{f_q^0}{f_{q+\Delta}^0}
ight) \ &\delta^{a*}_\infty(q) = \lim_{T o\infty} \delta^{a*}(0,q) = D_\xi + rac{1}{k} \ln\left(rac{f_q^0}{f_{q-\Delta}^0}
ight) \end{aligned}$$

▲□▶ ▲□

The case

$$egin{aligned} &\delta^{b*}_\infty(q) = \lim_{T o\infty} \delta^{b*}(0,q) = D_\xi + rac{1}{k} \ln\left(rac{f_q^0}{f_{q+\Delta}^0}
ight) \ &\delta^{a*}_\infty(q) = \lim_{T o\infty} \delta^{a*}(0,q) = D_\xi + rac{1}{k} \ln\left(rac{f_q^0}{f_{q-\Delta}^0}
ight) \end{aligned}$$

 $f^0 \in \mathbb{R}^{2Q+1}$ is characterized by:

$$\operatorname*{argmin}_{\|f\|_{2}=1} \sum_{|q| \leq Q} \alpha q^{2} f_{q}^{2} + \eta_{\xi} \left(\sum_{q=-Q}^{Q-\Delta} (f_{q+\Delta} - f_{q})^{2} + (f_{Q})^{2} + (f_{-Q})^{2} \right)$$

▲□▶▲□▶▲壹▶▲壹▶ 壹 ∽��?

The case
$$\Lambda^b(\delta)=\Lambda^a(\delta)=Ae^{-k\delta}$$
 (VI)

Continuous counterpart

 $ilde{f}^0\in L^2(\mathbb{R})$ characterized by:

$$\operatorname*{argmin}_{\|\tilde{f}\|_{L^2(\mathbb{R})}=1}\int_{-\infty}^{\infty}\left(\alpha x^2\tilde{f}(x)^2+\eta_{\xi}\Delta^2\tilde{f}'(x)^2\right)dx.$$

▲□▶ ▲□

The case
$$\Lambda^b(\delta)=\Lambda^a(\delta)=Ae^{-k\delta}$$
 (VI)

Continuous counterpart

 $ilde{f}^0 \in L^2(\mathbb{R})$ characterized by:

$$\operatorname*{argmin}_{\|\tilde{f}\|_{L^2(\mathbb{R})}=1}\int_{-\infty}^{\infty}\left(\alpha x^2\tilde{f}(x)^2+\eta_{\xi}\Delta^2\tilde{f}'(x)^2\right)dx.$$

$$ilde{f}^0(x) \propto \exp\left(-rac{1}{2\Delta}\sqrt{rac{lpha}{\eta_{\xi}}}x^2
ight)$$

▲□▶▲□▶▲壹▶▲壹▶ 壹 釣९0

The case
$$\Lambda^b(\delta)=\Lambda^a(\delta)=Ae^{-k\delta}$$
 (VI)

Continuous counterpart

 $\tilde{f}^0 \in L^2(\mathbb{R})$ characterized by:

$$\operatorname*{argmin}_{\|\tilde{f}\|_{L^2(\mathbb{R})}=1}\int_{-\infty}^{\infty}\left(\alpha x^2\tilde{f}(x)^2+\eta_{\xi}\Delta^2\tilde{f}'(x)^2\right)dx.$$

$$ilde{f}^0(x) \propto \exp\left(-rac{1}{2\Delta}\sqrt{rac{lpha}{\eta_\xi}}x^2
ight)$$

Hence, we get an approximation of the form:

$$f_q^0 \propto \exp\left(-rac{1}{2\Delta}\sqrt{rac{lpha}{\eta_{arepsilon}}}q^2
ight)$$

500

The case
$$\Lambda^b(\delta)=\Lambda^a(\delta)=Ae^{-k\delta}$$
 (VII)

Using the continuous counterpart, we get:

Closed-form approximations: optimal quotes (Model A: $\xi = \gamma$)

$$\begin{split} \delta^{b*}_{\infty}(q) &\simeq \quad \frac{1}{\Delta\xi} \ln\left(1 + \frac{\Delta\xi}{k}\right) + \frac{2q + \Delta}{2} \sqrt{\frac{\gamma\sigma^2}{2kA\Delta} \left(1 + \frac{\Delta\xi}{k}\right)^{1 + \frac{k}{\Delta\xi}}} \\ \delta^{a*}_{\infty}(q) &\simeq \quad \frac{1}{\Delta\xi} \ln\left(1 + \frac{\Delta\xi}{k}\right) - \frac{2q - \Delta}{2} \sqrt{\frac{\gamma\sigma^2}{2kA\Delta} \left(1 + \frac{\Delta\xi}{k}\right)^{1 + \frac{k}{\Delta\xi}}} \end{split}$$

Remark: these formulas are used by many practitioners in Europe and Asia on quote-driven markets.

The case
$$\Lambda^b(\delta)=\Lambda^a(\delta)=Ae^{-k\delta}$$
 (VIII)

Using the continuous counterpart, we get:

Closed-form approximations: optimal quotes (Model B: $\xi = 0$)

$$egin{array}{rcl} \delta^{b*}_{\infty}(q) &\simeq & rac{1}{k}+rac{2q+\Delta}{2}\sqrt{rac{\gamma\sigma^2 e}{2kA\Delta}} \ \delta^{a*}_{\infty}(q) &\simeq & rac{1}{k}-rac{2q-\Delta}{2}\sqrt{rac{\gamma\sigma^2 e}{2kA\Delta}} \end{array}$$

< □ ▶

The case
$$\Lambda^b(\delta)=\Lambda^a(\delta)=Ae^{-k\delta}$$
 (IX)

A good way to analyze the result is to consider the spread $\psi = \delta^b + \delta^a$ and the skew $\zeta = \delta^b - \delta^a$.

Closed-form approx.: spread and skew (Model A, $\xi = \gamma$)

$$\begin{split} \psi_{\infty}^{*}(q) &\simeq \frac{2}{\Delta\xi} \ln\left(1 + \frac{\Delta\xi}{k}\right) + \Delta\sqrt{\frac{\gamma\sigma^{2}}{2kA\Delta}} \left(1 + \frac{\Delta\xi}{k}\right)^{1 + \frac{k}{\Delta\xi}} \\ \zeta_{\infty}^{*}(q) &\simeq 2q\sqrt{\frac{\gamma\sigma^{2}}{2kA\Delta}} \left(1 + \frac{\Delta\xi}{k}\right)^{1 + \frac{k}{\Delta\xi}} \end{split}$$

< □

The case $\Lambda^{b}(\delta) = \Lambda^{a}(\delta) = Ae^{-k\delta}$ (X)

Closed form approx.: spread and skew (Model B, $\xi = 0$)

$$egin{array}{rcl} \psi^*_\infty(q) &\simeq& rac{2}{k} + \Delta \sqrt{rac{\gamma \sigma^2 e}{2kA\Delta}} \ \zeta^*_\infty(q) &\simeq& 2q \sqrt{rac{\gamma \sigma^2 e}{2kA\Delta}} \end{array}$$

The problem with precious metals

▲□▶▲□▶▲三▶▲三▶ ● ○ ○ ○

The problem with precious metals

- In many cases, market making on the spot market and hedging on both the (illiquid) spot market and the (liquid) futures market.
- Futures hedging is imperfect \rightarrow the remaining (basis) risk cannot be modelled with a Brownian motion: it is stationary.

500

- In many cases, market making on the spot market and hedging on both the (illiquid) spot market and the (liquid) futures market.
- Futures hedging is imperfect \rightarrow the remaining (basis) risk cannot be modelled with a Brownian motion: it is stationary.

The dynamics of prices (Nested OU)

- Spot: $dS_t = \sigma_S dW_t^S$, $\sigma_S > 0$.
- Futures: $F_t = S_t + E_t$.

The problem with precious metals

- In many cases, market making on the spot market and hedging on both the (illiquid) spot market and the (liquid) futures market.
- Futures hedging is imperfect \rightarrow the remaining (basis) risk cannot be modelled with a Brownian motion: it is stationary.

The dynamics of prices (Nested OU)

• Spot:
$$dS_t = \sigma_S dW_t^S$$
, $\sigma_S > 0$.

• Futures:
$$F_t = S_t + E_t$$
.
We want prices with linear dynamics to stay in the quadratic value case:

$$\begin{aligned} dE_t &= -k_E \left(E_t - D_t \right) dt + \sigma_E dW_t^E, \qquad k_E, \sigma_E > 0, \\ dD_t &= -k_D \left(D_t - \bar{D} \right) dt + \sigma_D dW_t^D, \qquad k_D, \sigma_D \ge 0, \quad \bar{D} \in \mathbb{R}, \end{aligned}$$

where $(W_t^S, W_t^E, W_t^D)_t$ is a three-dimensional Brownian motion with correlation matrix R (covariance matrix: Σ).

Cash

The resulting cash process $(X_t)_t$ follows:

$$dX_t = \int_{z=0}^{\infty} S^a(t,z) z J^a(dt,dz) - \int_{z=0}^{\infty} S^b(t,z) z J^b(dt,dz) -v_t^S S_t dt - L^S(v_t^S) dt - v_t^F F_t dt - L^F(v_t^F) dt$$

where $L^{S}(v_{t}^{S})$ and $L^{F}(v_{t}^{F})$ account for execution costs upon externalizing.

Stochastic optimal control

 $\exists \rightarrow 4$

Objective function

The goal is now to maximize

$$\mathbb{E}\left[-\exp\left(-\gamma\left(X_{T}+q_{T}^{S}S_{T}+q_{T}^{F}F_{T}-K\left((q_{T}^{S})^{2}+(q_{T}^{F})^{2}\right)\right)\right)\right]$$

by selecting δ^{b} , δ^{a} , v^{S} and v^{F} optimally.

Hamilton-Jacobi-Bellman equation

$$0 = \partial_t u - k_E (E - D) \partial_E u - k_D (D - \overline{D}) \partial_D u + \frac{1}{2} \operatorname{Tr} (\Sigma \nabla_{SED}^2 u) + \mathcal{L}^b u + \mathcal{L}^a u + \sup_{v^S} (v^S \partial_{q^S} u - (\mathcal{L}^S (v^S) + v^S S) \partial_x u) + \sup_{v^F} (v^F \partial_{q^F} u - (\mathcal{L}^F (v^F) + v^F (S + E)) \partial_x u)$$

with terminal condition

$$u(T, x, q^{S}, q^{F}, S, E, D) = -\exp(-\gamma \left(x + q^{S}S + q^{F}(S + E) - K\left((q^{S})^{2} + (q^{F})^{2}\right)\right)\right)$$

Ansatz

$$u(t, x, q^{S}, q^{F}, S, E, D) = -\exp\left(-\gamma\left(x + q^{S}S + q^{F}(S + E) + \theta(t, q^{S}, q^{F}, E, D)\right)\right)$$

Change of variables

Ansatz

$$u(t, x, q^{S}, q^{F}, S, E, D) = -\exp\left(-\gamma\left(x + q^{S}S + q^{F}(S + E) + \theta(t, q^{S}, q^{F}, E, D)\right)\right)$$

New equation for θ

The equation for θ becomes:

$$0 = \partial_{t}\theta - k_{E}(E-D)(q^{F}+\partial_{E}\theta) - k_{D}(D-\bar{D})\partial_{D}\theta + \frac{1}{2}\operatorname{Tr}(\widetilde{\Sigma}\nabla_{ED}^{2}\theta) \\ -\frac{\gamma}{2}\begin{pmatrix}q^{S}+q^{F}\\q^{F}+\partial_{E}\theta\\\partial_{D}\theta\end{pmatrix}^{\mathsf{T}}\Sigma\begin{pmatrix}q^{S}+q^{F}\\q^{F}+\partial_{E}\theta\\\partial_{D}\theta\end{pmatrix} + \mathcal{J}_{H}\theta + \mathcal{H}^{S}(\partial_{q^{S}}\theta) + \mathcal{H}^{F}(\partial_{q^{F}}\theta)$$

▲□▶▲□▶▲壹▶▲壹▶ 壹 りへの

Notations

- $\widetilde{\Sigma}$ is the submatrix of Σ obtained by removing the first row and the first column
- \mathcal{H}^{S} and \mathcal{H}^{F} are the Hamiltonian functions defined by

$$\mathcal{H}^{S}: p \in \mathbb{R} \mapsto \sup_{v^{S}} \left(v^{S} p - L^{S}(v^{S}) \right)$$
$$\mathcal{H}^{F}: p \in \mathbb{R} \mapsto \sup_{v^{F}} \left(v^{F} p - L^{F}(v^{F}) \right)$$

Nonlocal jump operators:

$$\mathcal{J}_{H}\theta(t,q^{S},q^{F},E,D) = \int_{0}^{\infty} zH\left(z,\frac{\theta(t,q^{S},q^{F},E,D)-\theta(t,q^{S}+z,q^{F},E,D)}{z}\right)\lambda(z)dz + \int_{0}^{\infty} zH\left(z,\frac{\theta(t,q^{S},q^{F},E,D)-\theta(t,q^{S}-z,q^{F},E,D)}{z}\right)\lambda(z)dz$$

with $H: (z,p) \in (0,+\infty) \times \mathbb{R} \mapsto \sup_{\delta} \frac{f(\delta)}{\gamma z} (1 - e^{-\gamma z(\delta - p)}).$

Solution

If we approximate the Hamiltonian terms by polynomials of degree 2, the resulting approximation of θ will be a polynomial of degree 2, with coefficients solving simple ODEs (Riccati and linear).

Solution

If we approximate the Hamiltonian terms by polynomials of degree 2, the resulting approximation of θ will be a polynomial of degree 2, with coefficients solving simple ODEs (Riccati and linear).

Optimal strategy

$$\begin{cases} \delta^{b*}(t,z) = \overline{\delta} \left(z, \frac{\theta(t,q_{t-}^S,q_t^F, E_t, D_t) - \theta(t,q_{t-}^S + z,q_t^F, E_t, D_t)}{z} \right) \\ \delta^{a*}(t,z) = \overline{\delta} \left(z, \frac{\theta(t,q_{t-}^S,q_t^F, E_t, D_t) - \theta(t,q_{t-}^S - z,q_t^F, E_t, D_t)}{z} \right) \\ v_t^{S*} = \mathcal{H}^{S'} \left(\partial_{q^S} \theta(t,q_{t-}^S,q_t^F, E_t, D_t) \right) \\ v_t^{F*} = \mathcal{H}^{F'} \left(\partial_{q^F} \theta(t,q_{t-}^S,q_t^F, E_t, D_t) \right) \end{cases}$$

where $\overline{\delta}(z,p) = f^{-1}(\gamma z H(z,p) - \partial_p H(z,p)).$

• The spot and futures prices are observable, so is the basis $(E_t)_t$.

- The spot and futures prices are observable, so is the basis $(E_t)_t$.
- $(D_t)_t$ is not observable. It has to be filtered.

500

• The spot and futures prices are observable, so is the basis $(E_t)_t$.

• $(D_t)_t$ is not observable. It has to be filtered.

The dynamics after filtering – Same Nested OU structure

Assuming $d\langle W^S, W^E \rangle = \rho dt$ and $\langle W^S, W^D \rangle = \langle W^E, W^D \rangle = 0$, we get:

• The spot and futures prices are observable, so is the basis $(E_t)_t$.

• $(D_t)_t$ is not observable. It has to be filtered.

The dynamics after filtering – Same Nested OU structure

Assuming $d\langle W^S, W^E \rangle = \rho dt$ and $\langle W^S, W^D \rangle = \langle W^E, W^D \rangle = 0$, we get:

$$dE_t = -k_E \left(E_t - \widehat{D}_t \right) dt + \sigma_E d\widehat{W}_t^E$$

$$d\widehat{D}_t = -k_D \left(\widehat{D}_t - \overline{D} \right) dt + \frac{1}{\sqrt{1 - \rho^2}} \frac{k_E}{\sigma_E} \nu_t^2 d\widehat{W}_t^D$$

where

$$\widehat{D}_t = \mathbb{E}\left[D_t|(S_s)_{s\leq t}, (E_s)_{s\leq t}\right], \quad \nu_t^2 = \mathbb{V}\left(D_t|(S_s)_{s\leq t}, (E_s)_{s\leq t}\right),$$

and

$$\widehat{W}_{t}^{E} = W_{t}^{E} + \frac{k_{E}}{\sigma_{E}} \int_{0}^{t} (D_{s} - \widehat{D}_{s}) ds \text{ and } \widehat{W}_{t}^{D} = \frac{\widehat{W}_{t}^{E} - \rho W_{t}^{S}}{\sqrt{1 - \rho^{2}}}$$
