1969: Man on the Moon

2

<http://www.unmuseum.org/moonhoax.htm>

- How can you prove that you are at a specific location?

What will you learn from this talk?

- Classical Cryptography
- Quantum Computation & Teleportation
- Position-Based Cryptography
- Garden-Hose Model

Classical Cryptography

- 3000 years of fascinating history
- Until 1970: **private communication** was the only goal

Scytale

Enigma

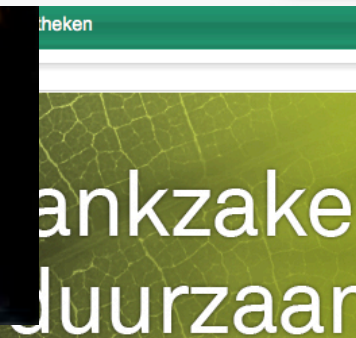

Modern Cryptography

5

- is **everywhere!**
- is concerned with all settings where people **do not trust** each other

Edward Snowden

Secure Encryption

6

$m = \text{'0d00e101'}$

Alice

$k = 0101\ 1011$

Eve

Bob

$k = 0101\ 1011$

- Goal: Eve **does not learn** the message
- Setting: Alice and Bob share a secret key k

eXclusive OR (XOR) Function

x	y	$x \oplus y$
0	0	0
1	0	1
0	1	1
1	1	0

- Some properties:

- $\forall x : x \oplus 0 = x$

- $\forall x : x \oplus x = 0$

$$\Rightarrow \forall x, y : x \oplus y \oplus y = x$$

One-Time Pad Encryption

8

$$m = 0000 \ 1111$$

$$c = m \oplus k = 0101 \ 0100$$

$$m = c \oplus k = 0000 \ 1111$$

Alice

$$k = 0101 \ 1011$$

Eve

Bob

$$k = 0101 \ 1011$$

- Goal: Eve **does not learn** the message
- Setting: Alice and Bob share a key k
- Recipe:

$$m = 0000 \ 1111$$

$$c = 0101 \ 0100$$

$$k = 0101 \ 1011$$

$$k = 0101 \ 1011$$

x	y	$x \oplus y$
0	0	0
0	1	1
1	0	1
1	1	0

$$c = m \oplus k = 0101 \ 0100$$

$$c \oplus k = 0000 \ 1111$$

$$c \oplus k = m \oplus k \oplus k = m \oplus 0 = m$$

- Is it secure?

Perfect Security

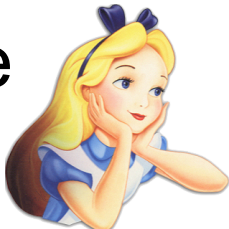

9

$$m = ?$$

$$c = m \oplus k = 0101 \ 0100$$

$$m = c \oplus k = ?$$

Alice

$k = ?$

$k = ?$
Eve

Bob

$k = ?$

- Given that
 - is it possible that
 - Yes, if $k = 0101 \ 0100$.
 - is it possible that
 - Yes, if $k = 1010 \ 1011$.
 - it is possible that
 - Yes, if $k = 0000 \ 0001$.
- In fact, every m is possible.
- Hence, the one-time pad is **perfectly secure**!

x	y	$x \oplus y$
0	0	0
0	1	1
1	0	1
1	1	0

Problems With One-Time Pad

10

$m = 0000 \ 1111$

$c = m \oplus k = 0101 \ 0100$

$m = c \oplus k = 0000 \ 1111$

Alice

$k = 0101 \ 1011$

Eve

Bob

$k = 0101 \ 1011$

- The key has to be **as long as** the message (Shannon's theorem)
- The key can only be **used once**.

Information Theory

11

- 6 EC MoL course, given in 2nd block: Nov/Dec 2017
- mandatory for Logic & Computation track
- first lecture: Tuesday, 31 October 2017, 9:00, C0.05
- <http://homepages.cwi.nl/~schaffne/courses/inftheory/2017/>

Claude Shannon

Mathematician

Claude Elwood Shannon was an American mathematician, electronic engineer, and cryptographer known as "the father of information theory". Shannon is famous for having founded information theory with a landmark paper that he published in 1948.

[Wikipedia](#)

Born: April 30, 1916, Petoskey, Michigan, United States

Died: February 24, 2001, Medford, Massachusetts, United States

Problems With One-Time Pad

12

$m = 0000 \ 1111$

$c = m \oplus k = 0101 \ 0100$

$m = c \oplus k = 0000 \ 1111$

Alice

$k = 0101 \ 1011$

Eve

Bob

$k = 0101 \ 1011$

- The key has to be **as long as** the message (Shannon's theorem)
- The key can only be **used once**.
- In practice, other encryption schemes (such as [AES](#)) are used which allow to encrypt long messages with short keys.
- One-time pad does not provide [authentication](#):
Eve can easily flip bits in the message

Symmetric-Key Cryptography

13

Alice

Eve

- Encryption insures **secrecy**:
Eve **does not learn** the message, e.g.
- Authentication insures **integrity**:
Eve **cannot alter** the message
- General problem: players have to exchange

Wonderland of Quantum Mechanics

Quantum is Real!

24

- generation of random numbers

(diagram from idQuantique white paper)

- no **quantum computation**, only **quantum communication** required

Can Quantum Computers Be Built?

25

- Possible to build in theory, no fundamental theoretical obstacles have been found yet.

Martinis group (Google)
9 qubits

- Canadian company “D-Wave” claims to have build a quantum computer with 2048 qubits. Did they?
- 2014/15: 135+50 Mio € investment in QuTech centre in Delft
- 2015: **QuSoft** center in Amsterdam
- 2017+: 1 Bio € EU flagship on Quantum Technology

No-Cloning Theorem

26

Proof: copying is a **non-linear operation**

Quantum Key Distribution (QKD)

[Bennett Brassard 84]

Alice

Bob

copy them

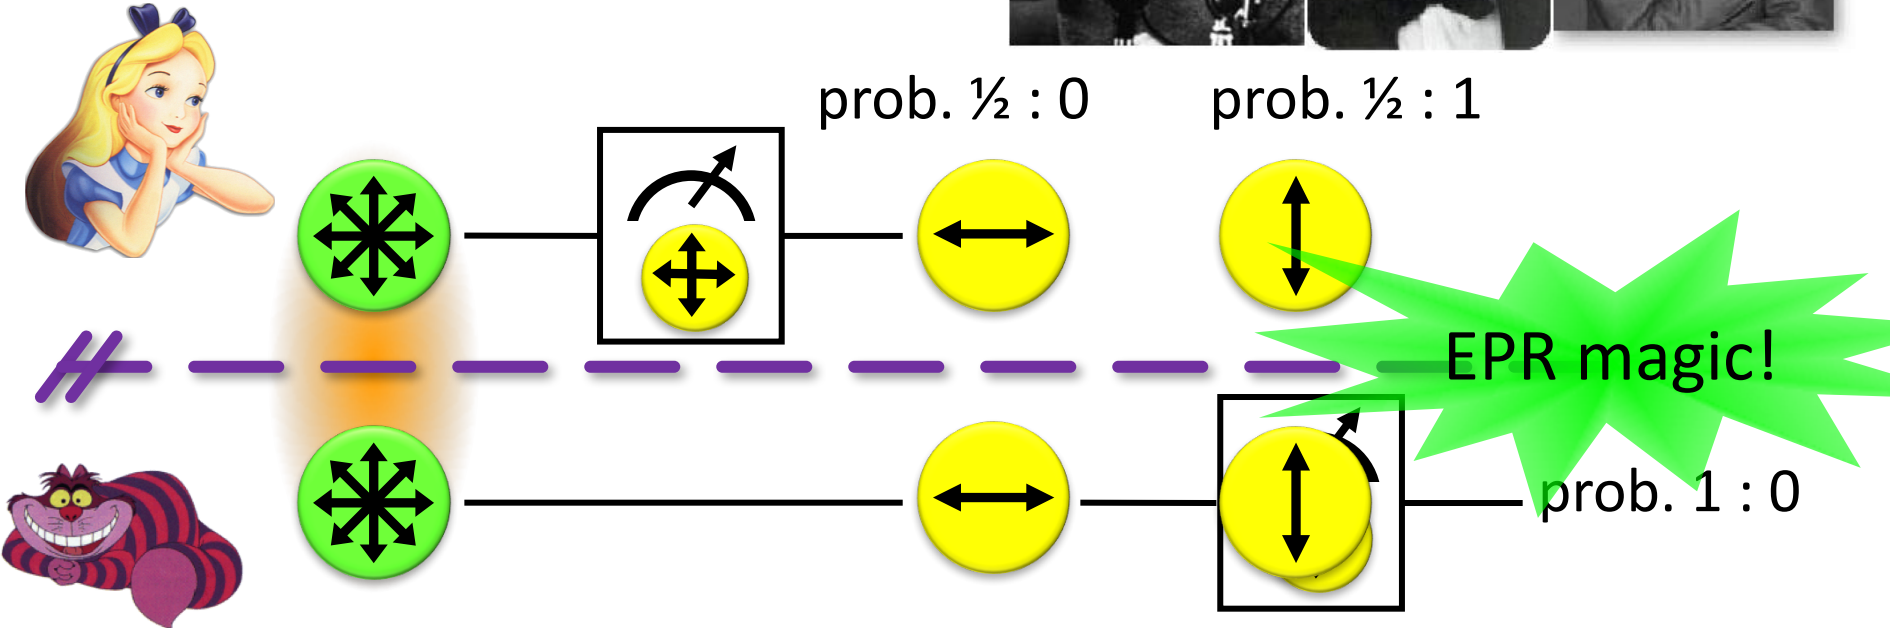

©2008 Vadim Makarov www.vad1.com

- secu
- c
- h

- **technically feasible**: no quantum computation required, only quantum communication

EPR Pairs

28 [Einstein Podolsky Rosen 1935]

- “spukhafte Fernwirkung” (spooky action at a distance)
- EPR pairs **do not allow to communicate** (no contradiction to relativity theory)
- can provide a shared random bit

Quantum Teleportation

29 [Bennett Brassard Crépeau Jozsa Peres Wootters 1997]

- does **not contradict relativity theory**
- teleported state can only be recovered once the classical information σ arrives

Quantum Computing

30

- 8 EC MasterMath course by Ronald de Wolf
- Starting in February 2018
- <https://homepages.cwi.nl/~rdewolf/qc18.html>

Quantum Cryptography

- [Online course on edx by Delft/Caltech](#) starts 14 Nov 2017
- 6 EC June project
- Probably again in June 2018
- <https://www.moodle.ch/lms/course/view.php?id=50>

What to Learn from this Talk?

- ✓ Classical Cryptography
- ✓ Quantum Computing & Teleportation

- Position-Based Cryptography

- Garden-Hose Model

How to Convince Someone of Your Presence at a Location

32

<http://www.unmuseum.org/moonhoax.htm>

Position-Based Cryptography

33

Can the geographical location of a player be used as sole cryptographic credential ?

- Possible Applications:
 - Launching-missile command comes from within the military headquarters
 - Talking to the correct country
 - Pizza-delivery problem / avoid fake calls to emergency services
 - ...

Position-Based Cryptography

34

Gamer krijgt SWAT-team in z'n nek: swatting

🕒 29-08-2014, 05:49 AANGEPAST OP 29-08-2014, 05:49

Zit je lekker een oorlogsspel te spelen, valt er ineens een SWAT-team binnen. Dat gebeurde een Amerikaanse gamer. Hij had net in de livestream van z'n spel *Counter Strike* tegen zijn medespelers 'I think we're being swatted' - toen de deur openbrak en inderdaad een zwaarbewapend arrestatieteam binnenviel.

Dat was allemaal live te zien op de webcam:

<https://youtu.be/TiW-BVPCbZk?t=117>

Basic task: Position Verification

35

- Prover wants to convince verifiers that she is at a **particular position**
- no **coalition of (fake) provers**, i.e. not at the claimed position, can convince verifiers
- assumptions:
 - communication at speed of light
 - instantaneous computation
 - verifiers can coordinate

Position Verification: First Try

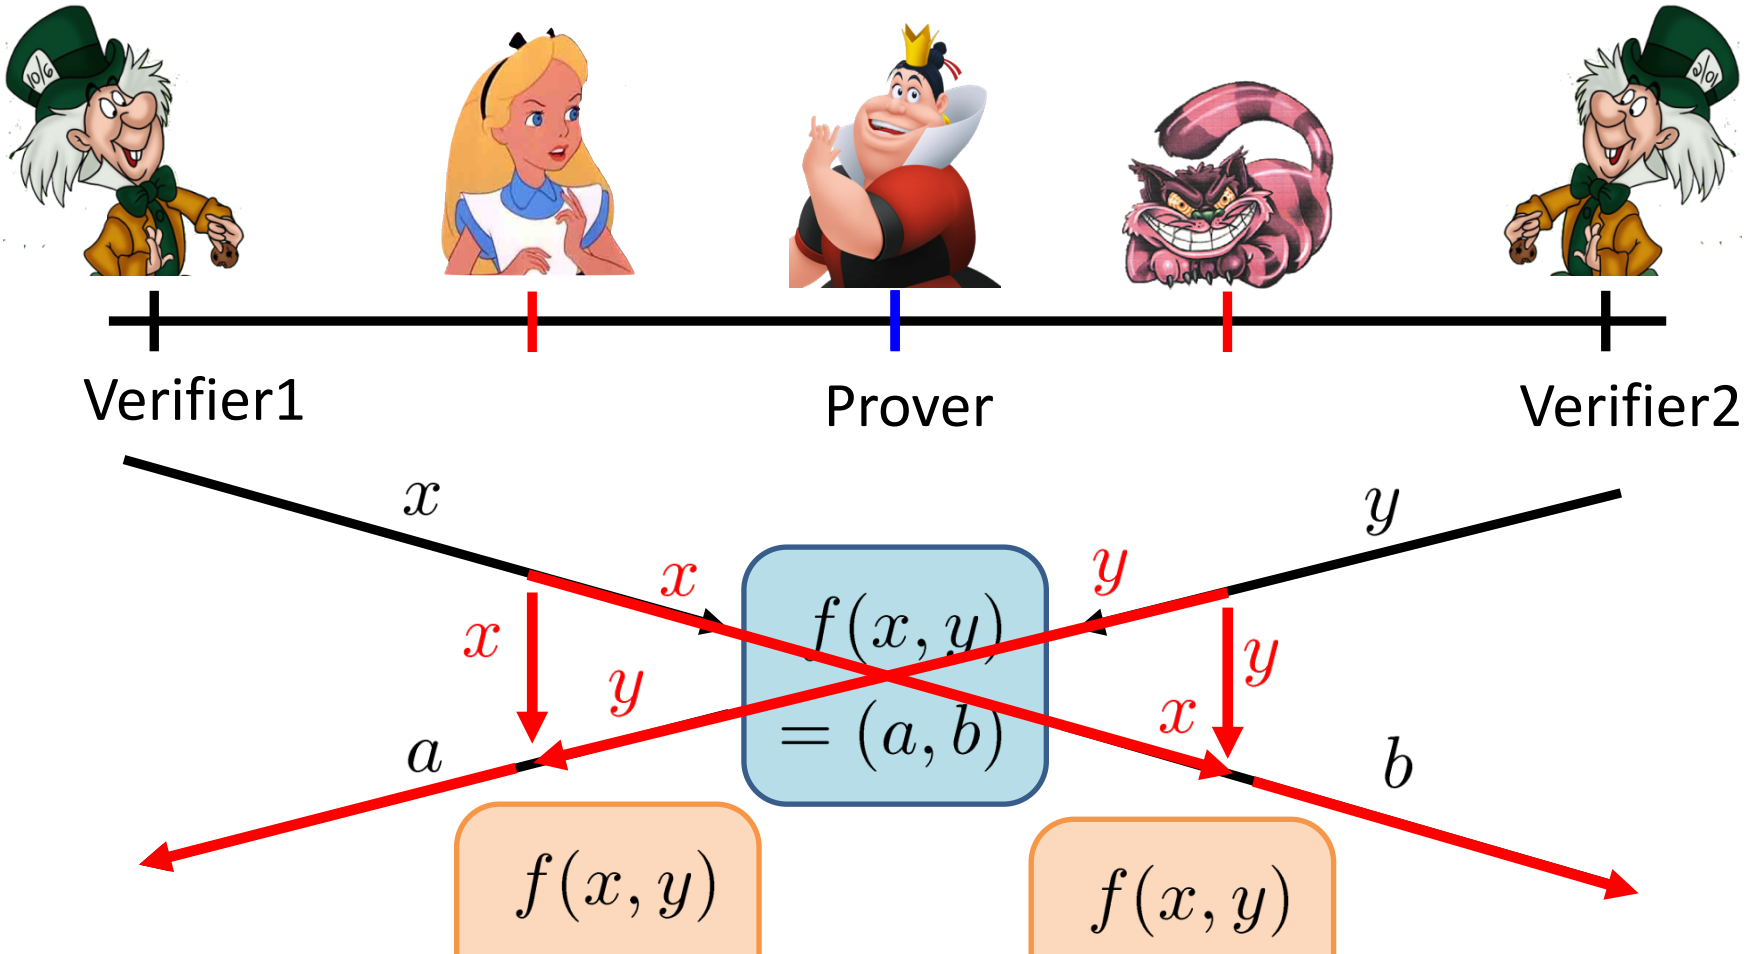

36

■ distance bounding [Brands Chaum '93]

Position Verification: Second Try

37

position verification is classically impossible !

[Chandran Goyal Moriarty Ostrovsky: CRYPTO '09]

Equivalent Attacking Game

38

$$f(x, y) = (a, b)$$

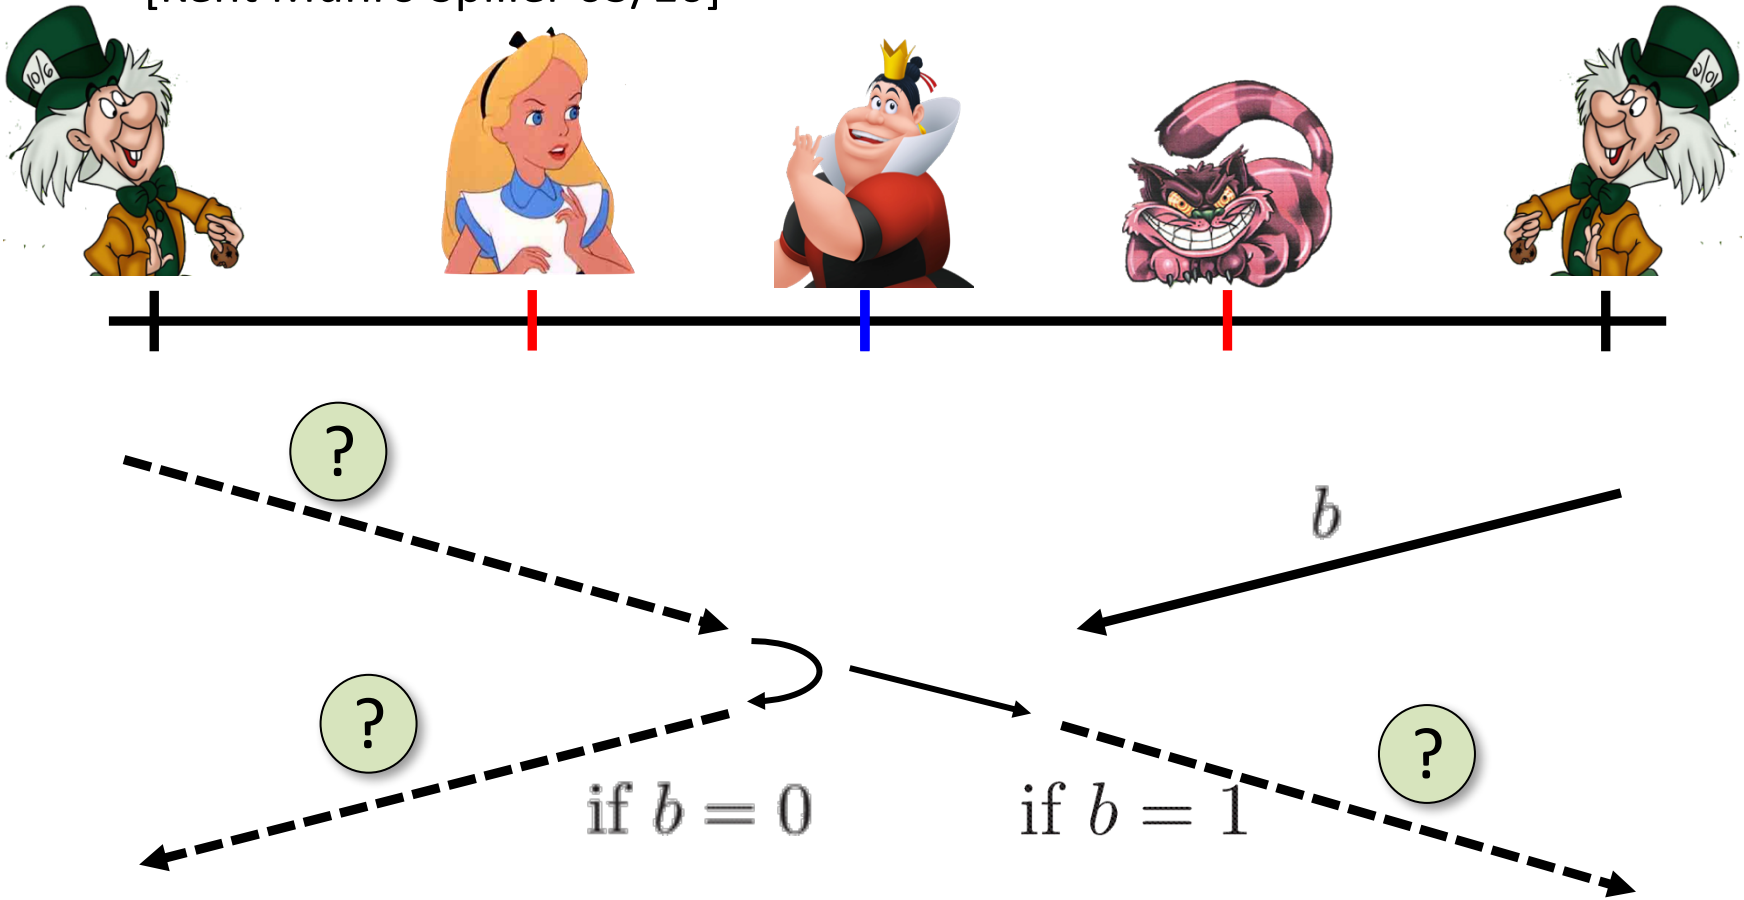

- independent messages m_x and m_y
- copying classical information
- this is impossible quantumly

Position Verification: Quantum Try

39

[Kent Munro Spiller 03/10]

- Let us study the attacking game

Attacking Game

40

- impossible
- but possible with entanglement!!

Entanglement attack

41

- done if $b=1$

Entanglement attack

42

- the correct person can reconstruct the qubit in time!
- the scheme is completely broken

more complicated schemes?

43

- Different schemes proposed by
 - Chandran, Fehr, Gelles, Goyal, Ostrovsky [2010]
 - Malaney [2010]
 - Kent, Munro, Spiller [2010]
 - Lau, Lo [2010]
- Unfortunately they can all be broken!
 - general **no-go theorem** [Buhrman, Chandran, Fehr, Gelles, Goyal, Ostrovsky, S 2014]

Most General Single-Round Scheme

44

- Let us study the attacking game

Distributed Q Computation in 1 Round

45

- using some form of **back-and-forth teleportation**, players succeed with probability arbitrarily close to 1
- requires an **exponential amount** of EPR pairs

No-Go Theorem

46

- Any position-verification protocol **can be broken** using an exponential number of EPR-pairs
- **Question:** is this optimal?
- Does there exist a protocol such that:
 - any **attack** requires many EPR-pairs
 - **honest** prover and verifiers efficient

Single-Qubit Protocol: SQP_f

47

[Kent Munro Spiller 03/10]

$$f : \{0, 1\}^n \times \{0, 1\}^n \rightarrow \{0, 1\}$$

efficiently computable

Attacking Game for SQP_f

48

- Define $E(SQP_f)$:= minimum number of EPR pairs required for attacking SQP_f

What to Learn from this Talk?

- ✓ Classical Cryptography
- ✓ Quantum Computing & Teleportation
- ✓ Position-Based Cryptography

- Garden-Hose Model

<http://arxiv.org/abs/1109.2563>

Buhrman, Fehr, Schaffner, Speelman

The Garden-Hose Model

50

$$f : \{0, 1\}^n \times \{0, 1\}^n \rightarrow \{0, 1\}$$

$$x \in \{0, 1\}^n$$

share s waterpipes

$$y \in \{0, 1\}^n$$

The Garden-Hose Model

51

$x \in \{0, 1\}^n$

$$f : \{0, 1\}^n \times \{0, 1\}^n \rightarrow \{0, 1\}$$

$f(x, y) = 0$ if water exits @ Alice

$f(x, y) = 1$ if water exits @ Bob

$y \in \{0, 1\}^n$

- based on their inputs, players connect pipes with pieces of hose
- Alice also connects a water tap

The Garden-Hose Model

52

$x \in \{0, 1\}^n$

$$f : \{0, 1\}^n \times \{0, 1\}^n \rightarrow \{0, 1\}$$

$f(x, y) = 0$ if water exits @ Alice

$f(x, y) = 1$ if water exits @ Bob

$y \in \{0, 1\}^n$

Garden-Hose complexity of f :

$\text{GH}(f) :=$ minimum number of pipes needed to compute f

Demonstration: Inequality on Two Bits

53

$$\begin{aligned}x &= x_1x_2 \\ &= 00\end{aligned}$$

$$\begin{aligned}y &= y_1y_2 \\ &= 10\end{aligned}$$

n-Bit Inequality Puzzle

54

- $\text{GH}(\text{Inequality}) \leq$
 - demonstration: $3n$
 - challenge: $2n + 1$ (first student to email me solution wins)

- world record: $\sim 1.359n$ [Chiu Szegedy et al 13]
- $\text{GH}(\text{Inequality}) \geq n$ [Pietrzak '11]

Relationship between
 $E(\text{SQP}_f)$ and $\text{GH}(f)$

$$\text{GH}(f) \geq E(\text{SQP}_f)$$

Garden-Hose

y

Attacking Game

y

$$\text{GH}(f) \geq E(\text{SQP}_f)$$

Garden-Hose

y

Attacking Game

y

x , Alice's
telep. keys

y , Bob's
telep. keys

- using x & y , can follow the water/qubit
- correct water/qubit using all measurement outcomes

$$\text{GH}(f) = E(\text{SQP}_f) ?$$

- last slide: $\text{GH}(f) \geq E(\text{SQP}_f)$
- The two models are **not equivalent**:
 - exists f such that $\text{GH}(f) = n$, but $E(\text{SQP}_f) \leq \log(n)$
- **Quantum** garden-hose model:
 - give Alice & Bob also entanglement
 - research question: are the models now equivalent?

Garden-Hose Complexity Theory

59

- every f has $\text{GH}(f) \leq 2^{n+1}$
- if f in logspace, then $\text{GH}(f) \leq \text{polynomial}$
 - efficient f & no efficient attack $\Rightarrow P \neq L$
- exist f with $\text{GH}(f)$ **exponential** (counting argument)
- for $g \in \{\text{equality, IP, majority}\}$: $\text{GH}(g) \geq n / \log(n)$
 - techniques from communication complexity
- Many open problems!
- Since then, we have used GH tricks to build **Quantum Fully Homomorphic Encryption**

What Have You Learned from this Talk?

✓ Classical Cryptography

✓ Quantum Computing & Teleportation

$|0\rangle_+$

$|1\rangle_+$

$|0\rangle_x$

$|1\rangle_x$

What Have You Learned from this Talk?

61

✓ Position-Based Cryptography

✓ No-Go Theorem

- Impossible unconditionally, but attack requires unrealistic amounts of resources

✓ Garden-Hose Model

- model of communication complexity

Take on the crypto challenge!

- GH(Inequality) = $2n + 1$ pipes
 - the first person to email me (cschaffner@uva.nl) the protocol wins:

- **course** “Information Theory”
- see you tomorrow at 9:00 in C0.05 !

Any f has $\text{GH}(f) \leq 2^{n+1}$

$$f : \{0, 1\}^n \times \{0, 1\}^n \longrightarrow \{0, 1\}$$

$x_1 x_2 \dots x_n$

$y_1 y_2 \dots y_n$

$f(x, y) = 1$

2^{n+1} pipes

$f(x, y) = 0$

$f(x, y) = 1$

Any f has $\text{GH}(f) \leq 2^{n+1}$

$$f : \{0, 1\}^n \times \{0, 1\}^n \longrightarrow \{0, 1\}$$

$x_1 x_2 \dots x_n$

$y_1 y_2 \dots y_n$

$\overbrace{00 \dots 0}^n$

$x_1 x_2 \dots x_n$

$f(x, y) = 0$

$\overbrace{11 \dots 1}^n$

$f(x, y) = 0$

2^{n+1} pipes

connects iff $f(00 \dots 0, y) = 0$

connects iff $f(x, y) = 0$

connects iff $f(11 \dots 1, y) = 0$

$f(x, y) = 1$

Open Problems

65

- Is **Quantum-GH(f)** equivalent to **$E(SQP_f)$** ?
- Find good lower bounds on **$E(SQP_f)$**
- Does $P \neq L/poly$ imply f in P with **$GH(f) > poly$** ?
- Are there other position-verification schemes?
- **Parallel repetition**, link with Semi-Definite Programming (SDP) and non-locality.
- **Implementation**: handle noise & limited precision
- Can we achieve other position-based primitives?

Quantum Operations

66

- are **linear isometries**
- can be described by a **unitary matrix**: $UU^\dagger = U^\dagger U = \text{id}$
- examples:
 - identity
 - bitflip (Pauli X): mirroring at $|0\rangle_x$ axis

Quantum Operations

67

- are **linear isometries**
- can be described by a **unitary matrix**: $UU^\dagger = \text{id}$
- examples:
 - identity
 - bitflip (Pauli X): mirroring at $|0\rangle_x$ axis
 - phase-flip (Pauli Z): mirroring at $|0\rangle_+$ axis
 - both (Pauli XZ)

Quantum Key Distribution (QKD)

[Bennett Brassard 84]

- inf-theoretic security against unrestricted eavesdroppers:
 - quantum states are unknown to Eve, she **cannot copy them**
 - honest players can check whether Eve interfered
- **technically feasible**: no quantum computation required, only quantum communication

Early results of QIP

69

- Efficient quantum algorithm for **factoring** [Shor'94]
 - breaks public-key cryptography (RSA)
- Fast quantum **search** algorithm [Grover'96]
 - **quadratic speedup**, widely applicable
- Quantum communication complexity
 - **exponential savings** in communication
- Quantum Cryptography [Bennett-Brassard'84, Ekert'91]
 - Quantum key distribution
