PART 1: KNOWLEDGE GRAPHS

What is a knowledge graph?

Why (knowledge) graphs?

- We're surrounded by entities, which are connected by relations
- We need to store them somehow, e.g., using a **DB** or a **graph**
- Graphs can be processed efficiently and offer a convenient
 abstraction

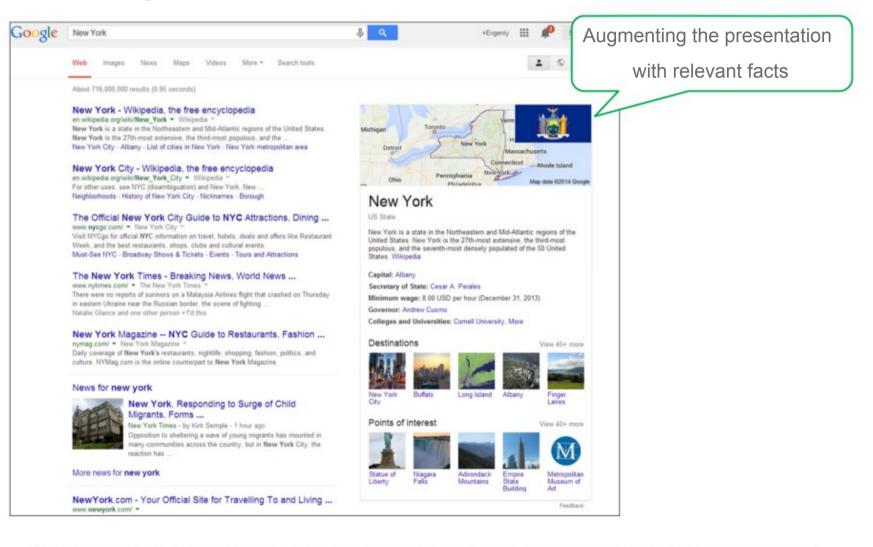

A sampler of research problems

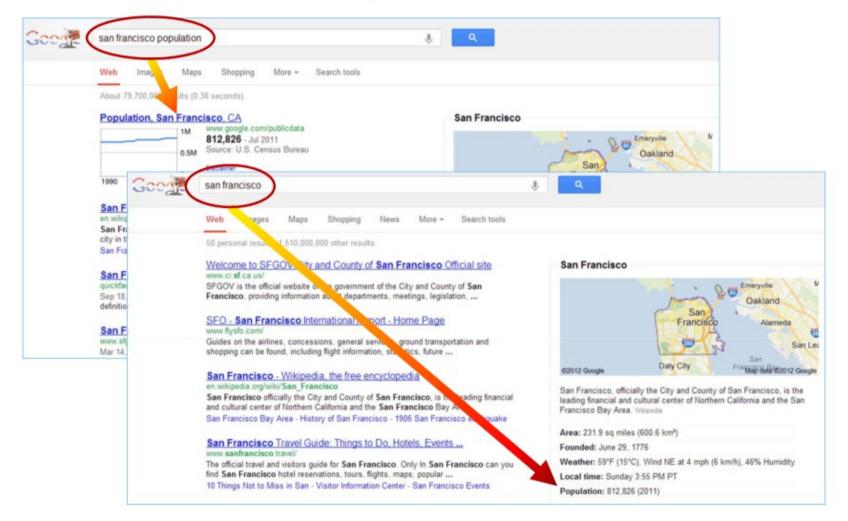

- Growth: knowledge graphs are incomplete!
 - Link prediction: add relations
 - Ontology matching: connect graphs
 - *Knowledge extraction*: extract new entities and relations from web/text
- Validation: knowledge graphs are not always correct!
 - Entity resolution: merge duplicate entities, split wrongly merged ones
 - Error detection: remove false assertions
- Interface: how to make it easier to access knowledge?
 - Semantic parsing: interpret the meaning of queries
 - Question answering: compute answers using the knowledge graph
- Intelligence: can AI emerge from knowledge graphs?
 - Automatic reasoning and planning
 - Generalization and abstraction

A SAMPLER OF APPLICATIONS OF KNOWLEDGE GRAPHS

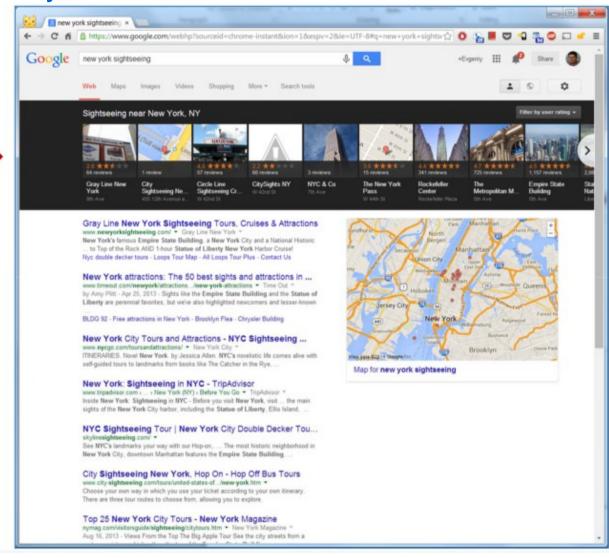

Surfacing structured results in web search

Surfacing facts proactively

Exploratory search

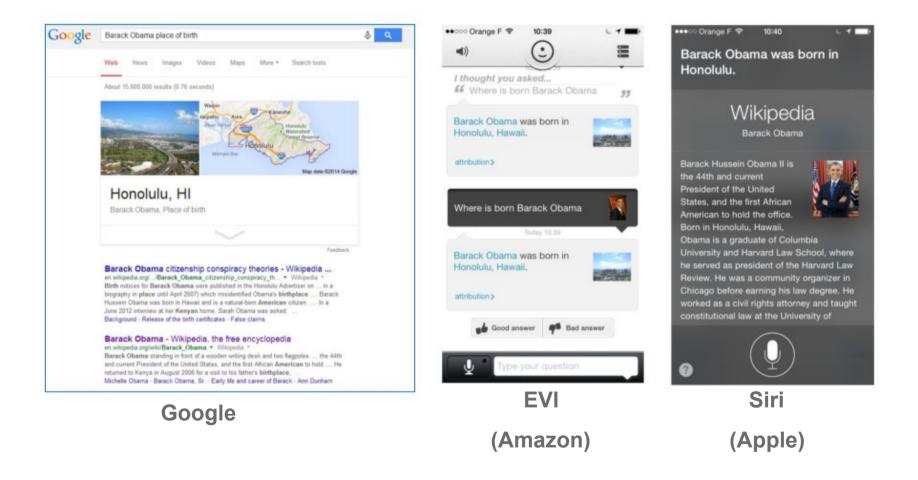

Connecting people, places and things

Interface revolution \Diamond

FREEBASE AS AN EXAMPLE OF A LARGE SCALE KNOWLEDGE REPOSITORY

Different approaches to knowledge representation

- Structured (e.g., Freebase or YAGO)
 - Both entities and relations come from a fixed lexicon
- Semi-structured
 - Predicates come from a fixed lexicon, but entities are strings
- Unstructured (Open IE)

- Freebase is an open, <u>Creative Commons licensed repository</u> of <u>structured data</u>
- Typed entities rather than strings

Person Type Key: /people/person Includes: Topic Aperson is a human being (man, woman or child) know Table Diagram	in to have actually existed. Living persons, celebrit	es and politicians are persons	Relations are

KNOWLEDGE ACQUISITION FROM TEXT

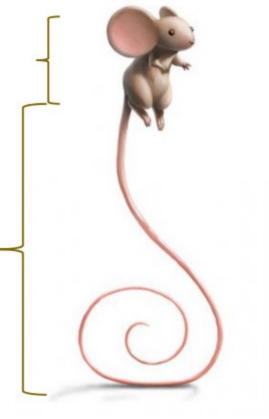

KDD 2014 Tutorial on Constructing and Mining Web-scale Knowledge Graphs, New York, August 24, 2014

Knowledge acquisition

- Relying on humans
 - Volunteer contributions at Freebase.com
 - Import of large datasets (e.g., IMDB)
 - Head + torso
- Automatic extraction
 - Extraction from web pages
 - The long tail
 - Learning patterns using known facts
- "... jumped from X into Y ..."

</en/tower_bridge,

/transportation/bridge/body_of_water_spanned, /en/river_thames>

http://www.flickr.com/photos/sandreli/4691045841/

Limits of automatic extraction

- Freebase: 637M (non-redundant) facts
- Knowledge Vault (automatically extracted):
 302M confident facts with Prob(true)> 0.9
 - Of those, 223M are in Freebase (~ 35%)

1

Implicitly stated information

1 In the beginning God created the heaven and the earth.

² And the earth was without form, and void; and darkness was upon the face of the deep. And the Spirit of God moved upon the face of the waters.

3 And God said, Let there be light: and there was light.

(Genesis 2)

7 And the LORD God **formed man** of the dust of the ground, and breathed into his nostrils the breath of life; and man became a living soul.

8 And the LORD God planted a garden eastward in Eden; and there he put the man whom he had formed.

19 And out of the ground the LORD God formed every beast of the field, and every fowl of the air; and brought them unto

mother **Adam**to see what he would call them: and whatsoever **Adam** called every living creature, that was the name thereof.

Article Talk

Read View source View history Search Barack Obama From Wikipedia, the free encyclopedia "Obama" redirects here. For other uses, see Obama (disambiguation). This article is about the 44th president of the United States. For his father, see Barack Obama, Sr. Barack Hussein Obama II (e//bairo k hu joeth ou ba mail bom Assess 4, 1961) is the 44th and current President of the United States, the first African American to hold the office. Born in

Honolulu, Hawaii, Obama is a graduate of Columbia University and Harvard Law School, where he was president of the Harvard Law Review. He was a community organizer in Chicago before earning his law degree. He worked as a civil rights attorney in Chicago and taught constitutional law at the University of Chicago Law School from 1992 to 2004. He served three terms representing the 13th District in the Illinois Senate from 1997 to 2004, running unsuccessfully for the United States House of Representatives in 2000

In 2004. Obama received national attention during his campaign to represent Illinois in the United States Senate with his victory in the March Democratic Party primary, his keynote address at the Democratic National Convention in July, and his election to the Senate in November. He began his presidential campaign in 2007. and in 2008, after a close primary campaign against Hillary Rodham Clinton, he won sufficient delegates in the Democratic Party primaries to receive the presidential nomination. He then defeated Republican nominee John McCain in the general election, and was inaugurated as president on January 20, 2009. Nine months after his Preceded by George W. Bush election. Obama was named the 2009 Nobel Peace Prize laureate. During his first two years in office. Obama signed into law economic stimulus legislation in response to the Great Recession in the form of the American Recovery and Reimestment Act of 2009 and the Tax Relief, Unemployment Insurance Reauthorization, and Job Creation Act of 2010. Other major domestic initiatives in his first term include the Patient Protection and Affordable Care Act, often referred to as "Obamacare"; the Dodd-Frank Wall Street Reform and Consumer Protection Act: and the Don't Ask. Don't Tell Repeal Act of 2010. In foreign policy, Obama ended U.S. military involvement in the Iraq War, increased U.S. troop levels in Alghanistan, signed the New START arms control treaty with Russia, ordered U.S. military involvement in Libya, and ordered the military operation that resulted in the death of Osama bin Laden. He later became the first sitting U.S. president to publicly support same-sex maniage. In November 2010, the Republicans regained control of the House of

How to jointly acquire knowledge from all these sources?

Speech/sounds

Artificial worlds?

PART 2: METHODS AND

TECHNIQUES

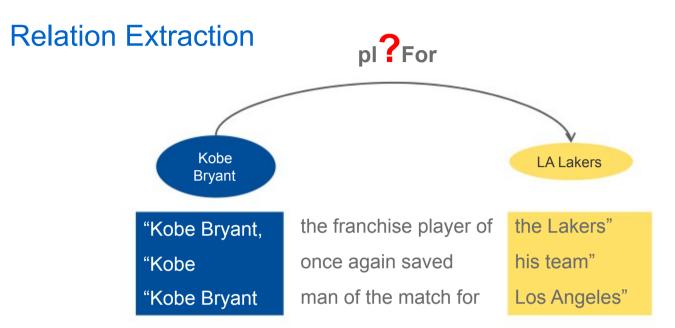

A sampler of research problems

- Growth: knowledge graphs are incomplete!
 - Link prediction: add relations
 - Ontology matching: connect graphs
 - *Knowledge extraction*: extract new entities and relations from web/text
- Validation: knowledge graphs are not always correct!
 - Entity resolution: merge duplicate entities, split wrongly merged ones
 - Error detection: remove false assertions
- Interface: how to make it easier to access knowledge?
 - Semantic parsing: interpret the meaning of queries
 - Question answering: compute answers using the knowledge graph
- Intelligence: can AI emerge from knowledge graphs?
 - Automatic reasoning and planning
 - Generalization and abstraction

Methods and techniques

- 1. Relation extraction:
 - Supervised models
 - Semi-supervised models
 - Distant supervision
- 2. Entity resolution
 - Single entity methods
 - Relational methods
- 3. Link prediction
 - Rule-based methods
 - Probabilistic models
 - Factorization methods
 - Embedding models

RELATION EXTRACTION

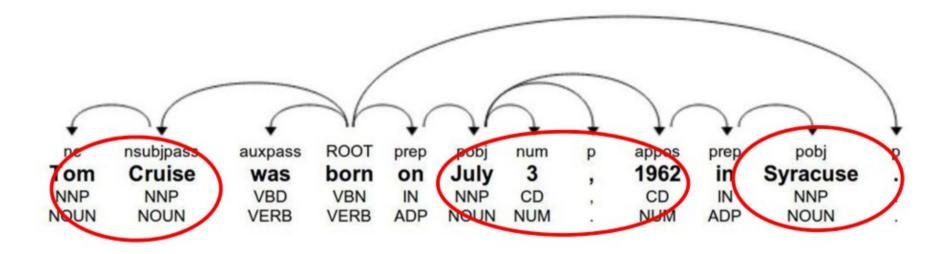

- Extracting semantic relations between sets of [grounded] entities
- Numerous variants:
 - Undefined vs pre-determined set of relations
 - **Binary** vs n-ary relations, facet discovery
 - Extracting temporal information
 - Supervision: {fully, un, semi, distant}-supervision
 - Cues used: only lexical vs full linguistic features

Supervised relation extraction

- Sentence-level labels of relation mentions
 - "Apple CEO Steve Jobs said.." => (SteveJobs, CEO, Apple)
 - "Steve Jobs said that Apple will.." => NIL
- Traditional relation extraction datasets
 - ACE 2004
 - MUC-7
 - Biomedical datasets (e.g BioNLP clallenges)
- Learn classifiers from +/- examples
- Typical features: context words + POS, dependency path between entities, named entity tags, token/parse-path/entity distance

Examples of features

X was born on DDDD in Y

DEP: X <nsubjpass / born prep> on pobj> DATE prep> in pobj> Y

- **NER**: X = PER, Y = LOC
- POS: X = NOUN, NNP; Y = NOUN, NNP
- Context: born, on, in , "born on"

Supervised relation extraction

• Used to be the "traditional" setting [Riloff et al., 06; Soderland et al., 99]

• Pros

- High quality supervision
- Explicit negative examples

• Cons

- Very expensive to generate supervision
- Not easy to add more relations
- Cannot generalize to text from different domains

Semi-supervised relation extraction

Generic algorithm

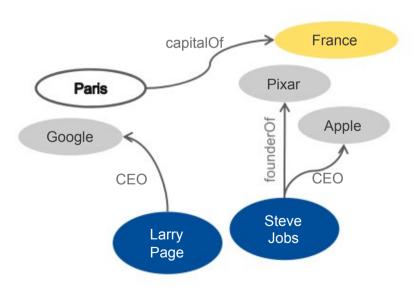

- 1. Start with seed triples / golden seed patterns
- 2. Extract patterns that match seed triples/patterns
- 3. Take the top-k extracted patterns/triples
- 4. Add to seed patterns/triples
- 5. Go to 2
- Many published approaches in this category:
 - Dual Iterative Pattern Relation Extractor [Brin, 98]
 - Snowball [Agichtein & Gravano, 00]
 - TextRunner [Banko et al., 07] almost unsupervised
- Differ in pattern definition and selection

TextRunner [Banko et al., 07]

- Almost unsupervised
 - Relations not fixed: does not follow Knowledge Graph schema (growing)
 - No labeled data
 - Mostly unlabeled text
 - Uses heuristics to self-label a starting corpora (using a parser), such as
 - Path length < k
 - Path does not cross sentence-like boundaries like relative clauses
 - Neither entity is a pronoun
- Self-training
 - Generate +/- examples ◊ learn classifier
 - Extract new relation mentions using this classifier
 - Generate triples from aggregated mentions, assign probabilistic score using [Downey et. al., 2005]
- Later improved in Reverb [Fader et al., 11]

Distantly-supervised relation extraction

- Existing knowledge base + unlabeled text (> generate examples
 - · Locate pairs of related entities in text
 - Hypothesizes that the relation is expressed

Google CEO Larry Page announced that... Steve Jobs has been Apple for a while... Pixar lost its co-founder Steve Jobs... I went to Paris, France for the summer...

Distant supervision

• Pros

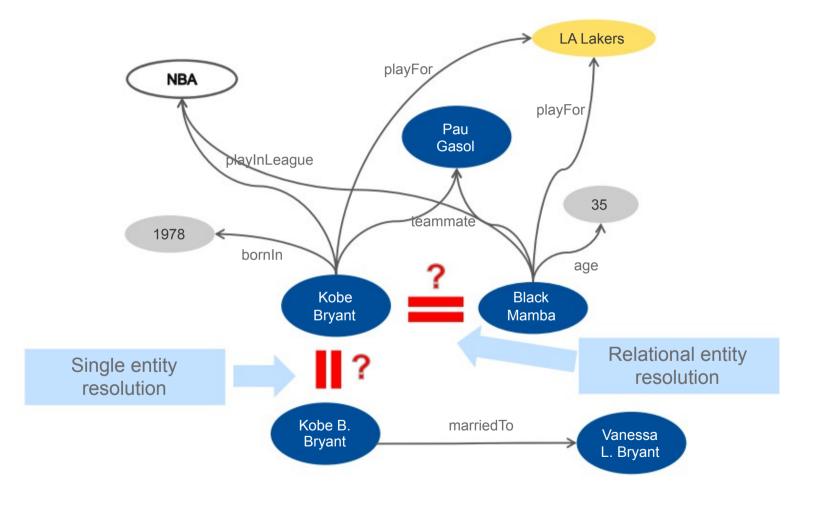

- Can scale to the web, as no supervision required
- Generalizes to text from different domains
- Generates a lot more supervision in one iteration

Cons

- Needs high quality entity-matching
- Relation-expression hypothesis can be wrong
 - Can be compensated by the extraction model, redundancy, language model
- Does not generate negative examples
 - Partially tackled by matching unrelated entities

ENTITY RESOLUTION

Entity resolution

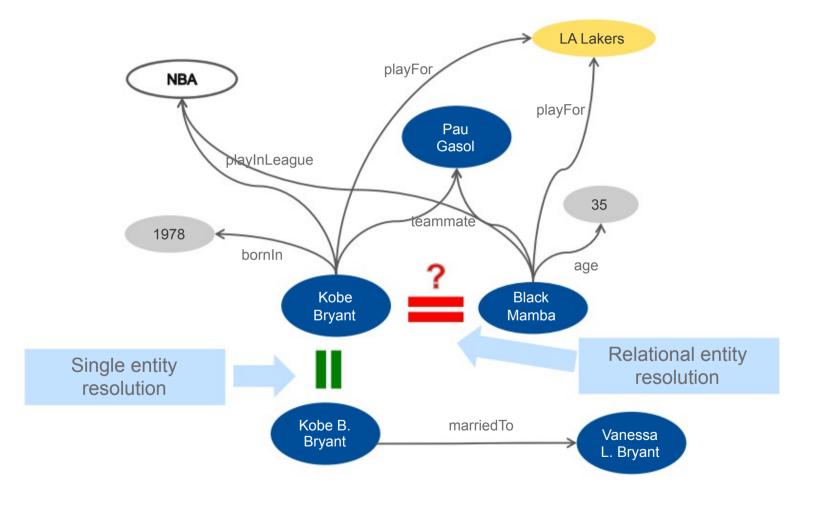

KDD 2014 Tutorial on Constructing and Mining Web-scale Knowledge Graphs, New York, August 24, 2014

Single entity resolution

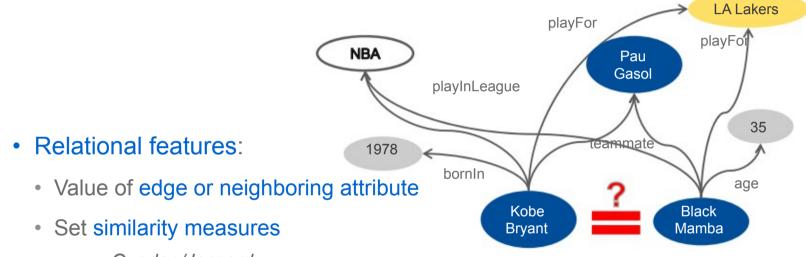

- Entity resolution without using the relational context of entities
- Many distances/similarities for single-entity entity resolution:
 - Edit distance (Levenshtein, etc.)
 - Set similarity (TF-IDF, etc.)
 - Alignment-based
 - Numeric distance between values
 - Phonetic Similarity
 - Equality on a boolean predicate
 - Translation-based
 - Domain-specific

Entity resolution

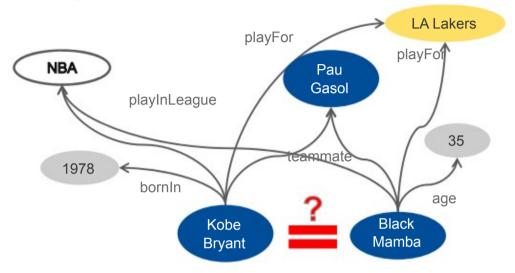

Relational entity resolution - Simple strategies

Enrich model with relational features () richer context for matching

- Overlap/Jaccard
- Average similarity between set members
- Adamic/Adar: two entities are more similar if they share more items that are overall less frequent
- *SimRank*: two entities are similar if they are related to similar objects
- Katz score: two entities are similar if they are connected by shorter paths

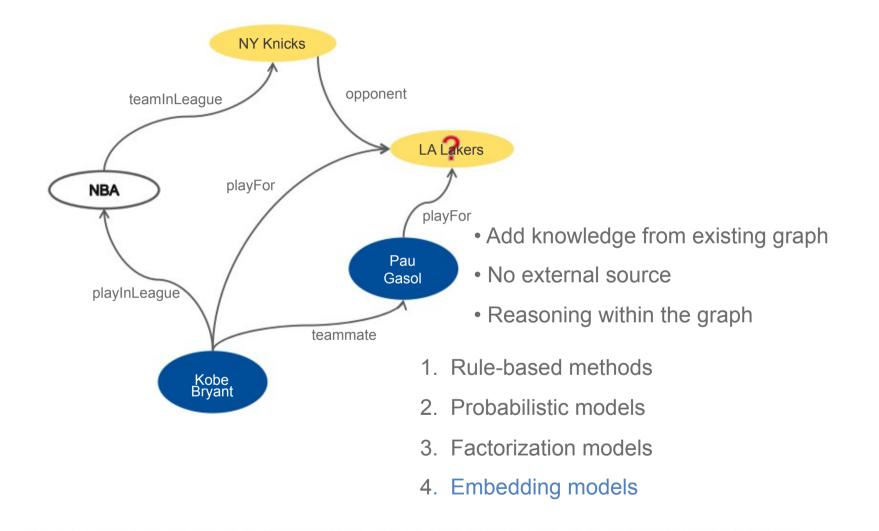

Relational entity resolution - Advanced strategies

- Dependency graph approaches [Dong et al., 05]
- Relational clustering [Bhattacharya & Getoor, 07]
- Probabilistic Relational Models [Pasula et al., 03]
- Markov Logic Networks [Singla & Domingos, 06]
- Probabilistic Soft Logic [Broecheler & Getoor, 10]

LINK PREDICTION

Link prediction

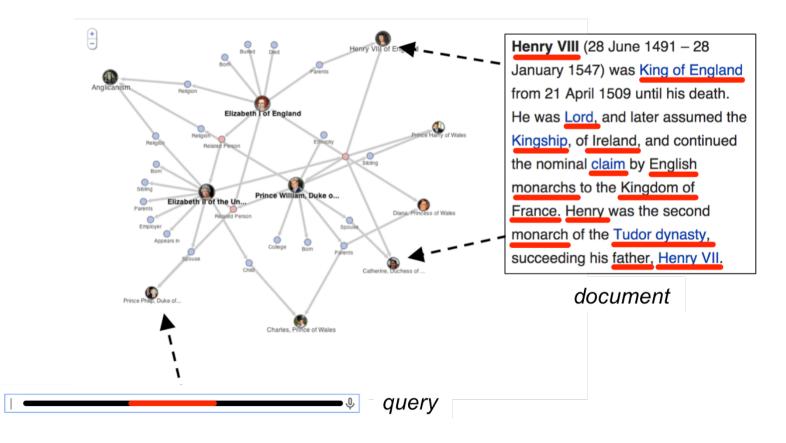

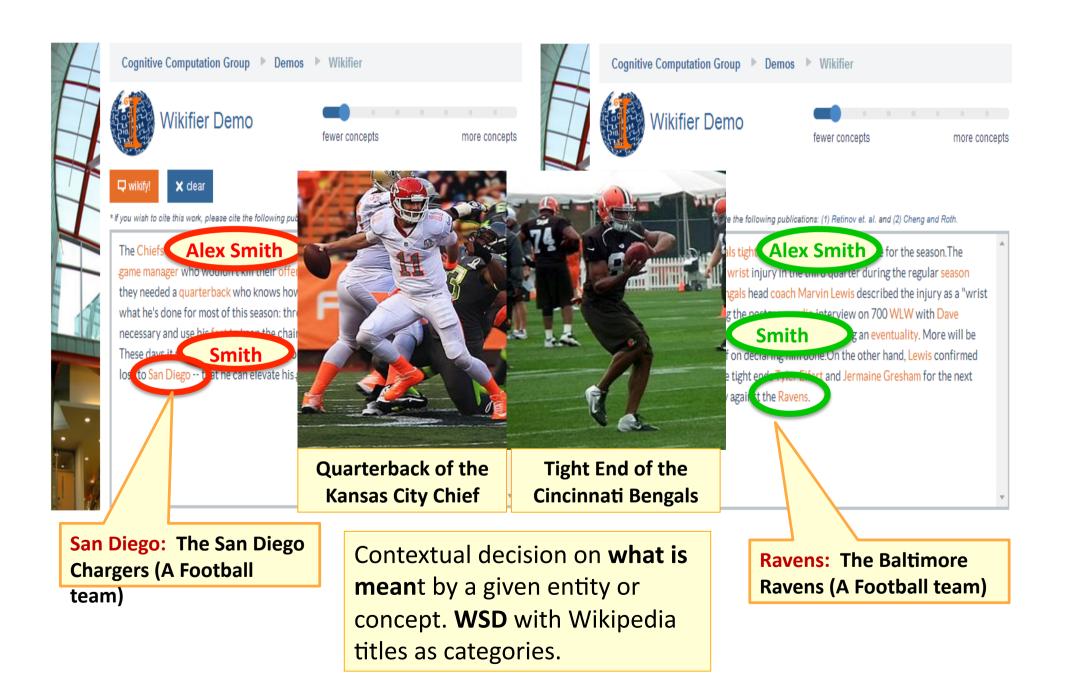

PART 3: ACCESS KNOWLEDGE

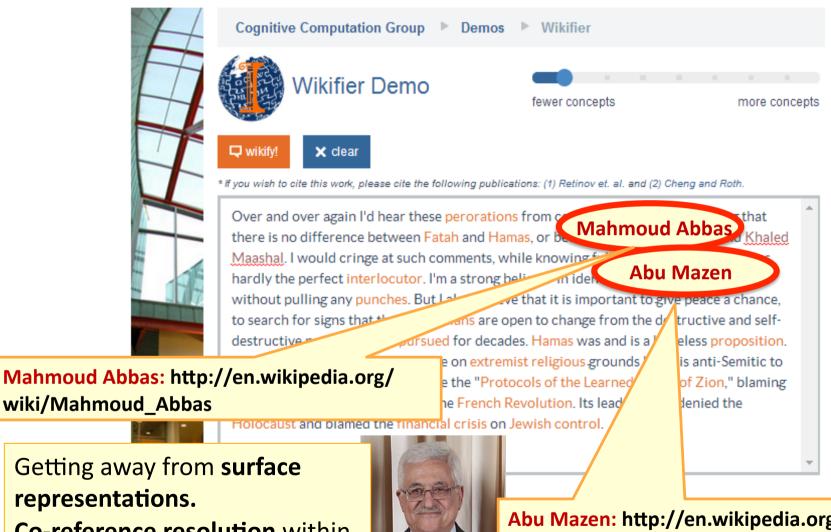

BY ENTITY LINKING

Entity Linking Documents

- Disambiguate every mention (=entity reference) on the Web
- Link token spans in documents to knowledge graph (e.g. Freebase, Wikipedia) entities

Co-reference resolution within and across documents, with grounding

If you wish to cite this work, please cite the following publications: (1) Retinov et. al. and (2) Cheng and Roth.

Human immunodeficiency virus (HIV) is the primary etiologic agent responsible for the AIDS pandemic. We constructed a fusion of the gp41 membrane-proximal external region (MPER) peptide along with a variable-length (Gly4Ser)x linker (where x is 4 or 8) between the C terminus of the former and N terminus of the latter. The His-tagged recombinant proteins, expressed in BL21(DE3)pLysS cells and purified by immobilized metal affinity chromatography followed by gel filtration, were found to display a nanomolar efficacy in blocking BaL-pseudotyped HIV-1 infection of HOS.T4.R5 cells. This antiviral activity was HIV-1 specific, since it did not inhibit cell infection by vesicular stomatitis virus (VSV). The chimeric proteins were found to release intraviral p24 protein from both BaL-pseudotyped HIV-1 and fully infectious BaL HIV-1 in a dose-dependent manner in the absence of host cells. The addition of either MPER or CVN was found to outcompete this virolytic effect, indicating that both components of the chimera are required for virolysis. The finding that engaging the Env protein spike and membrane using a chimeric ligand can destabilize the virus and lead to inactivation opens up a means to investigate virus particle metastability and to evaluate this approach for inactivation at the earliest stages of exposure to virus and before host cell encounter.

- . .

clinical presentation is identical to the very important foot and mouth disease virus.

1. Determine "linkable" phrases

- mention detection
- 2. Rank/select candidate entity links
 - link generation
- 3. Use "context" to disambiguate/filter/improve
 - disambiguation

A sampler of research problems

- **Growth:** knowledge graphs are incomplete!
 - Link prediction: add relations
 - Ontology matching: connect graphs
 - *Knowledge extraction*: extract new entities and relations from web/text
- Validation: knowledge graphs are not always correct!
 - *Entity resolution*: merge duplicate entities, split wrongly merged ones
 - Error detection: remove false assertions
- Interface: how to make it easier to access knowledge?
 - Semantic parsing: interpret the meaning of queries
 - Question answering: compute answers using the knowledge graph
- Intelligence: can AI emerge from knowledge graphs?
 - Automatic reasoning and planning
 - Generalization and abstraction

Knowledge is crucial yet difficult to acquire

- Knowledge is crucial for many AI tasks
- Knowledge acquisition
 - From experts: slow and mostly reliable
 - From non-experts: faster and not always reliable
 - Automated: fastest and most scalable, yet noisiest
- Knowledge availability
 - A lot can be found online
 - A lot cannot be found
 - A lot cannot be extracted using today's methods

Where we are today

- We can extract a lot of knowledge from text and model its correctness
- Enforcing structure makes the extraction problem easier yet imposes limitations
- Leveraging existing knowledge repositories helps a lot

Next steps

- We need new extraction methods, from new sources
- Extracting from modalities other than text appears promising yet mostly unexplored

Plenty to be learned, problems are far from solved!

- ¬ Vibrant research area
- ¬ Numerous open research questions
