smart contract

- term introduced by Nick szabo in the 1996

Smart Contracts: Building Blocks for Digital Markets

Glossary

(This is a partial rewrite of the article which appeared in Extropy #16)

Introduction

The contract, a set of promises agreed to in a "meeting of the minds", is the traditional way to formalize a relationship. While contracts are primarily used in business relationships (the focus of this article), they can also involve personal relationships such as marraiges. Contracts are also important in politics, not only because of "social contract" theories but also because contract enforcement has traditionally been considered a basic function of capitalist governments.

Whether enforced by a government, or otherwise, the contract is the basic building block of a free market economy. Over many centuries of cultural evolution has emerged both the concept of contract and principles related to it, encoded into common law. Algorithmic information theory suggests that such evolved structures are often prohibitively costly to recompute. If we started from scratch, using reason and experience, it could take many centuries to redevelop sophisticated ideas like property rights that make the modern free market work [Hayek].

smart contract

Smart Contracts: Building Blocks for Digital Markets

Glossary

(This is a partial rewrite of the article which appeared in Extropy #16)

Introduction

The contract, a set of promises agreed to in a "meeting of the minds", is the traditional way to formalize a relationship. While contracts are primarily used in business relationships (the focus of this article), they can also involve personal relationships such as marraiges. Contracts are also important in politics, not only because of "social contract" theories but also because contract enforcement has traditionally been considered a basic function of capitalist governments.

Whether enforced by a government, or otherwise, the contract is the basic building block of a free market economy. Over many centuries of cultural evolution has emerged both the concept of contract and principles related to it, encoded into common law. Algorithmic information theory suggests that such evolved structures are often prohibitively costly to recompute. If we started from scratch, using reason and experience, it could take many centuries to redevelop sophisticated ideas like property rights that make the modern free market work [Hayek].

Bitcoin: A Peer-to-Peer Electronic Cash System

Satoshi Nakamoto
satoshin@gmx.com
www.bitcoin.org

Abstract. A purely peer-to-peer version of electronic cash would allow online payments to be sent directly from one party to another without going through a financial institution. Digital signatures provide part of the solution, but the main benefits are lost if a trusted third party is still required to prevent double-spending. We propose a solution to the double-spending problem using a peer-to-peer network. The network timestamps transactions by hashing them into an ongoing chain of

Smart Contracts Glossary, Nick Szabo (1995)

“smart contract”

A set of promises,

> *including protocols within which the parties perform on the other promises.*

The protocols are usually implemented with programs on a computer network, or in other forms of digital electronics,

> *thus these contracts are "smarter" than their paper-based ancestors.*

No use of artificial intelligence is implied.

"smart contract"

a bilateral contract is a formal agreement in which both parties exchange promises to perform

***A set of promises**,*

including protocols within which the parties perform on the other promises.

The protocols are usually implemented with programs on a computer network, or in other forms of digital electronics,

thus these contracts are "smarter" than their paper-based ancestors.

No use of artificial intelligence is implied.

"smart contract"

A set of promises,

rules, procedures constraining the interaction

including ***protocols within which the parties perform*** *on the other promises.*

The protocols are usually implemented with programs on a computer network, or in other forms of digital electronics,

thus these contracts are "smarter" than their paper-based ancestors.

No use of artificial intelligence is implied.

Smart Contracts Glossary, Nick Szabo (1995)

"smart contract"

A set of promises,

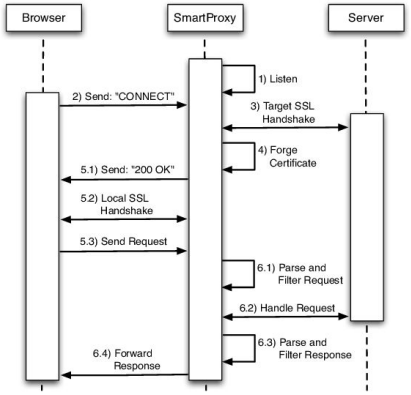
rules, procedures constraining the interaction

including protocols within which the parties perform on the other promis

*The **protocols** are usually **implemented with programs** on a computer network, or in other forms of digital electronics,*

thus these contracts are "smarter" than their paper-based ancestors.

No use of artificial intelligence is implied.



"smart contract"

A set of promises,

> *including protocols within which the parties perform on the other promises.*

The protocols are usually implemented with programs on a computer network, or in other forms of digital electronics,

> *thus these contracts are **"smarter"** than their paper-based ancestors.* ???

No use of artificial intelligence is implied.

"smart contract"

A set of promises,

> *including protocols within which the parties perform on the other promises.*

The protocols are usually implemented with programs on a computer network, or in other forms of digital electronics,

> *thus these contracts are "smarter" than their paper-based ancestors.*

No use of artificial intelligence is implied.

then, smart in what sense?

- According to the vulgata:
  - as the contract will perform exactly as designed
  - it eliminates the need for “trust” amongst the parties
  - ...and traditional third-parties (lawyers, notaries, courts) whose activity is meant to increase the confidence in the contract

then, smart in what sense?

- According to the vulgata:
  - as the contract will perform exactly as designed
  - it eliminates the need for “trust” amongst the parties
  - ...and traditional third-parties (lawyers, notaries, courts) whose activity is meant to increase the confidence in the contract

- smart perhaps in the sense of *economically profitable*?

$$$

then, smart in what sense?

crucial critical point to all this enterprise!!!

- According to the vulgata:
  - as **the contract will perform exactly as designed**
  - it eliminates the need for “trust” amongst the parties
  - ...and traditional third-parties (lawyers, notaries, courts) whose activity is meant to increase the confidence in the contract

- smart perhaps in the sense of *economically profitable*?

***ex-ante* enforcement**

tokens!

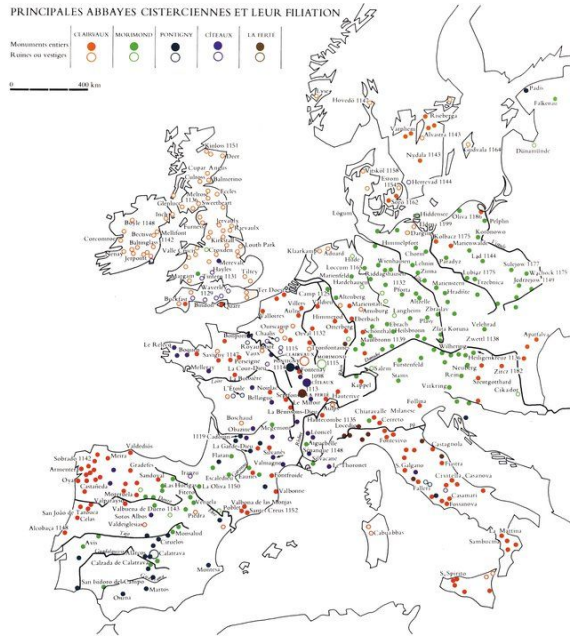
- What to protect?
  - (valuable?) digital assets
  - “contracts” (reified as assets)
  - automated performance

in terms of medieval technology

- How to protect (the content of) a book from invasions, wars, and plagues?

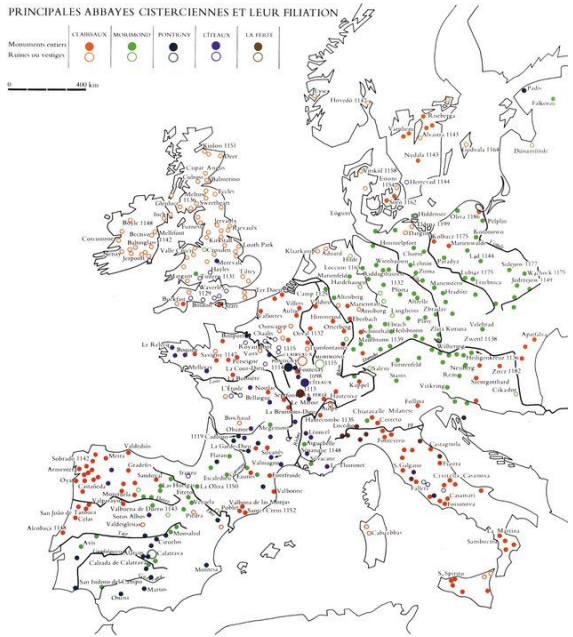
in terms of medieval technology

- How to protect (the content of) a book from invasions, wars, and plagues?
- Copy it, and distribute the copies through a network of monasteries!



in terms of medieval technology

- How to protect (the content of) a book from invasions, wars, and plagues?
- Copy it, and distribute the copies through a network of monasteries!



If a node is destroyed, a copy is still maintained in all others!!!

in terms of medieval technology

- Typically copying bring errors, exemplars of the book are never identical

in terms of medieval technology

- Typically copying bring errors, exemplars of the book are never identical

technological improvement:

introduce **error checking** machinery, typically via additional content used to **check integrity**

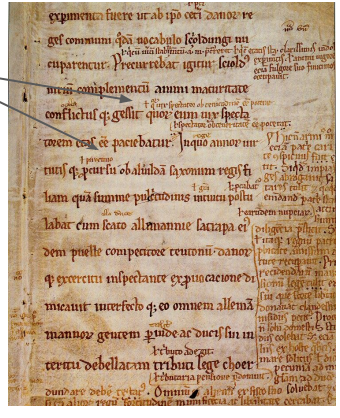
in terms of medieval technology

- Typically copying bring errors, exemplars of the book are never identical

technological improvement:

introduce **error checking** machinery, typically via additional content used to **check integrity**

e.g. *glosses* rephrasing the meaning of some word



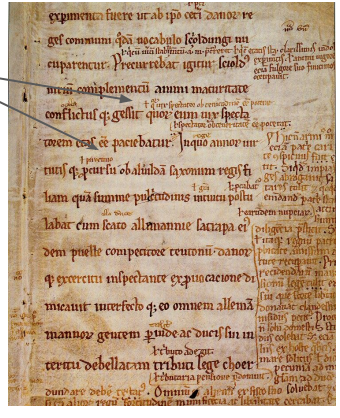
in terms of medieval technology

- Typically copying bring errors, exemplars of the book are never identical

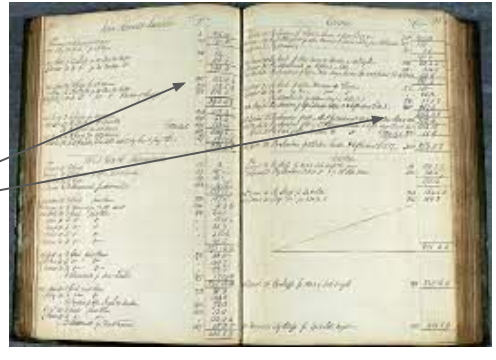
technological improvement:

introduce **error checking** machinery, typically via additional content used to **check integrity**

e.g. *glosses* rephrasing the meaning of some word



double entry bookkeeping (Florence, Venice ~1300)



in terms of medieval technology

- Typically copying bring errors, exemplars of the book are never identical

- Introduce **conflict resolution strategies**
  - philology provides several methods to “reconstruct” the original source, e.g. majority of sources, comparative analysis, provenance history

in terms of medieval technology

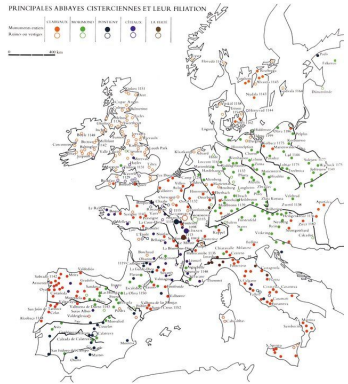
- Typically copying bring errors, exemplars of the book are never identical

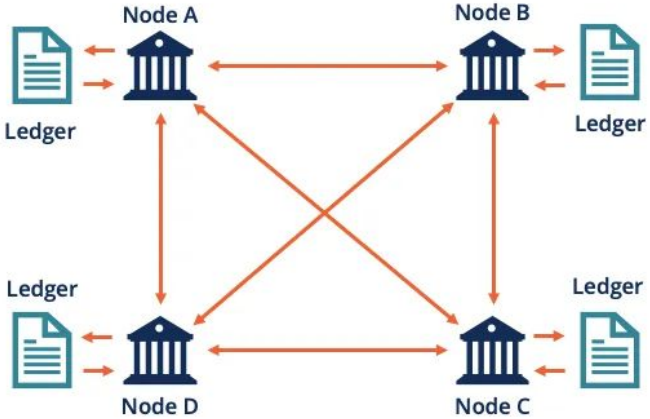
“consensus” protocol

- Introduce **conflict resolution strategies**
  - philology provides several methods to “reconstruct” the original source, e.g. *majority of sources*, comparative analysis, provenance history

“blockchain” =

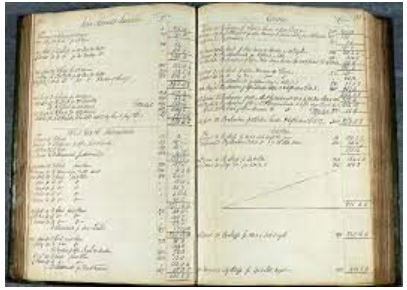
- **distributed** ledger + consensus protocol



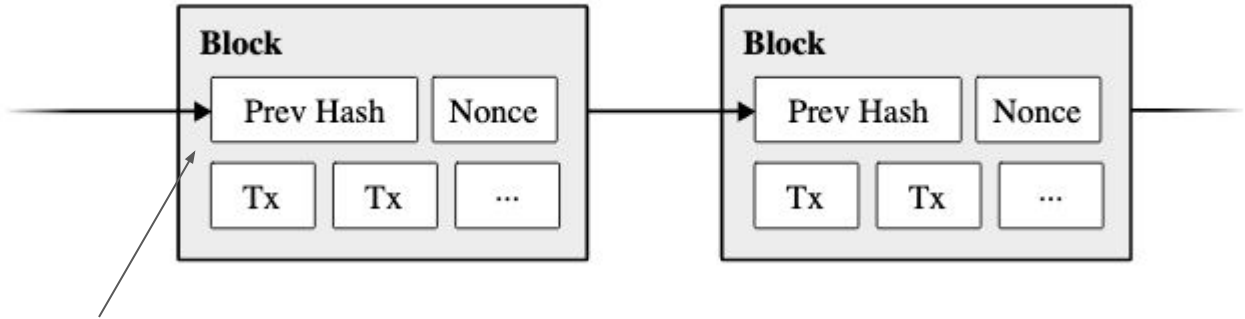


the same ledger is copied across the network

"blockchain" =



- distributed ledger + consensus protocol

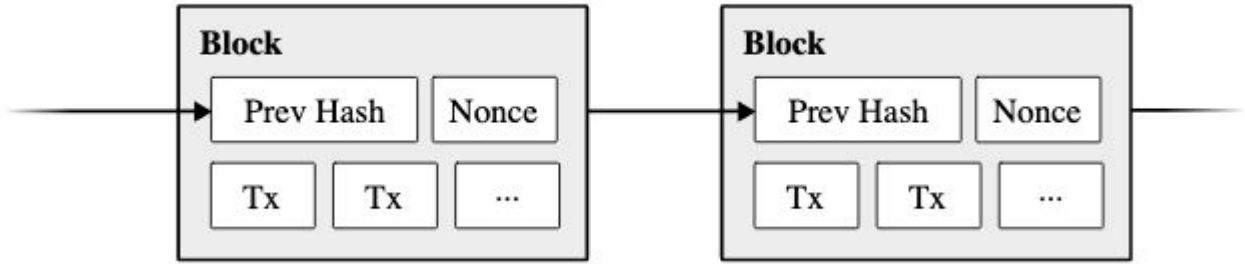


the ledger embeds machinery to test its integrity

compressed information (a sort of *fingerprint*) of the previous block, if the previous block is modified its hash is not the same

"blockchain" =

- distributed ledger + consensus protocol



checks for integrity are performed across the network, no central authority

techniques: **Proof of Work (PoW), Proof of Stake (PoS), etc.**

English Auction

English auction for NFT.

Auction

1. Seller of NFT deploys this contract.
2. Auction lasts for 7 days.
3. Participants can bid by depositing ETH greater than the current highest bidder.
4. All bidders can withdraw their bid if it is not the current highest bid.

After the auction

1. Highest bidder becomes the new owner of NFT.
2. The seller receives the highest bid of ETH.

cloned on each node
running in a decentralized fashion

- What are the **differences** with respect to other programs?

“smart contract” most used meaning

= immutable low-level instructions
cloned on each node
running in a decentralized fashion

- What are the **gaps** with usual contracts?

“smart contract” most used meaning

= immutable low-level instructions
cloned on each node
running in a decentralized fashion

- What are the **gaps** with usual contracts?

a bilateral contract is a formal agreement in which both parties exchange promises to perform

contracts vs “smart contracts”

- **Readability**: parties should understand what the agreement is about

contracts vs “smart contracts”

- **Readability**: parties should understand what the agreement is about
- **Control**: parties should maintain autonomy on performance. e.g. non-foreseeable conditions may cause justifiable release of duty, that can be assessed only *ex-post*

contracts vs “smart contracts”

- **Readability**: parties should understand what the agreement is about
- **Control**: parties should maintain autonomy on performance. e.g. non-foreseeable conditions may cause justifiable release of duty, that can be assessed only *ex-post*
- **Amendment**, **Delegation**, **Mandate,** etc. are all common constructs applicable on contracts (unless explicitly disabled), but not in smart contracts.

contracts vs “smart contracts”

- **Readability**: parties should understand what the agreement is about
- **Control**: parties should maintain autonomy on performance. e.g. non-foreseeable conditions may cause justifiable release of duty, that can be assessed only *ex-post*
- **Amendment**, **Delegation**, **Mandate,** etc. are all common constructs applicable on contracts (unless explicitly disabled), but not in smart contracts.
- **Regulation:** there is not an equivalent of contract law or private law regulations (a sort of meta-contracts) in smart contracts

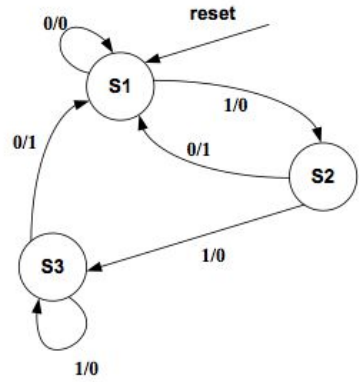
contracts vs "smart contracts"

- **Readability**: parties should understand what the agreement is about
- **Control**: parties should maintain autonomy on performance. e.g. non-foreseeable conditions may cause justifiable release of duty, that can be assessed only *ex-post*
- **Amendment**, **Delegation**, **Mandate,** etc. are all common constructs applicable on contracts (unless explicitly disabled), but not in smart contracts.
- **Regulation:** there is not an equivalent of contract law or private law regulations (a sort of meta-contracts) in smart contracts
- **Informational model (e.g. normative primitives):** contemporary smart contracts allow to specify *imperative instructions* driving performance mapping only to positive duties. What about prohibitions? What about permissions, legal competences?

cf. normative systems, computational theory of law

contracts vs “smart contracts”

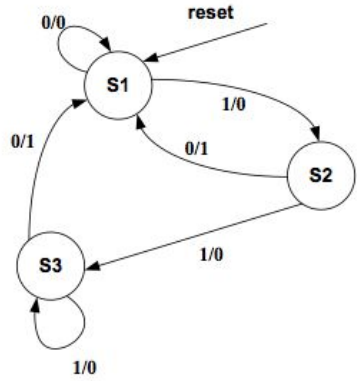
- Readability
- Control and *ex-post* enforcement
- Amendment, Delegation, Mandate
- Regulation
- Informational model



In most practical applications smart contracts depend on offline events, triggered by oracles. The environment “sets” the pace of execution.

contracts vs "smart contracts"

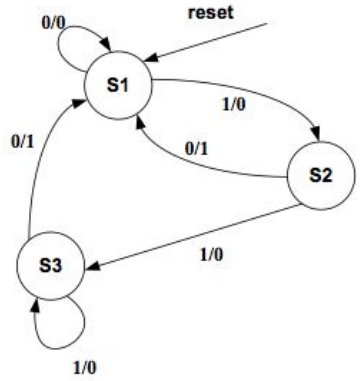
- Readability
- Control and *ex-post* enforcement
- Amendment, Delegation, Mandate
- Regulation
- Informational model



However, the **"dynamics" of contracts** depends not only on performance-related elements, but also **on contextual factors** (legal, social, physical) that ***modify the contract semantics*** itself.

contracts vs "smart contracts"

- Readability
- Control and *ex-post* enforcement
- Amendment, Delegation, Mandate
- Regulation
- Informational model

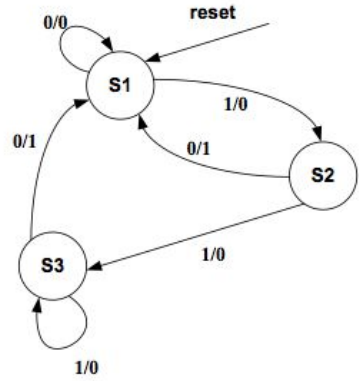


However, the **"dynamics" of contracts** depends not only on performance-related elements, but also **on contextual factors** (legal, social, physical) that ***modify the contract semantics*** itself.

The question is: **Can any socio-institutional systems (legal or not) be sustainable without these capacities?**

contracts vs "smart contracts" vs digital enforceable contracts?

- Readability
- Control and *ex-post* enforcement
- Amendment, Delegation, Mandate
- Regulation
- Informational model



However, the **"dynamics" of contracts** depends not only on performance-related elements, but also **on contextual factors** (legal, social, physical) that ***modify the contract semantics*** itself.

The question is: **Can any socio-institutional systems (legal or not) be sustainable without these capacities?**
