Non-wellfounded proof theory for modal fixed point logics

Main idea: replace an *explicit induction rule* by allowing infinite branches (satisfying some condition).

$$\operatorname{iw}_{L} \underbrace{ \begin{array}{c} \vdots \\ p, \mathbb{B}(p \to \Box p) \Rightarrow \mathbb{B}p \\ \hline p, \mathbb{B}(p \to \Box p) \Rightarrow p \end{array}}_{p, \mathbb{B}(p \to \Box p) \Rightarrow \mathbb{B}p} \underbrace{ \begin{array}{c} \vdots \\ p, \mathbb{B}(p \to \Box p) \Rightarrow \mathbb{B}p \\ \hline p, \mathbb{B}(p \to \Box p) \Rightarrow p \end{array}}_{p, \mathbb{B}(p \to \Box p) \Rightarrow \mathbb{B}p} \underbrace{ \begin{array}{c} \hline p, \mathbb{B}(p \to \Box p) \Rightarrow \mathbb{B}p \\ \hline p, \mathbb{B}(p \to \Box p) \Rightarrow p, \mathbb{B}p \end{array}}_{p, \mathbb{B}(p \to \Box p) \Rightarrow \mathbb{B}p} \underbrace{ \begin{array}{c} \hline p, \mathbb{B}(p \to \Box p) \Rightarrow \mathbb{B}p \\ \hline p, \mathbb{B}(p \to \Box p) \Rightarrow p, \mathbb{B}p \end{array}}_{p, \mathbb{B}(p \to \Box p) \Rightarrow \mathbb{B}p} \underbrace{ \begin{array}{c} \hline p, \mathbb{B}(p \to \Box p) \Rightarrow \mathbb{B}p \\ \hline p, \mathbb{B}(p \to \Box p) \Rightarrow \mathbb{B}p \end{array}}_{\mathbb{B}_{R}} \mathbb{B}_{L} \end{aligned}}_{p, \mathbb{B}(p \to \Box p) \Rightarrow \mathbb{B}p} \underbrace{ \begin{array}{c} \hline p, \mathbb{B}(p \to \Box p) \Rightarrow \mathbb{B}p \\ \hline p, \mathbb{B}(p \to \Box p) \Rightarrow \mathbb{B}p \end{array}}_{\mathbb{B}_{R}} \underbrace{ \begin{array}{c} \hline p, \mathbb{B}(p \to \Box p) \Rightarrow \mathbb{B}p \\ \hline p, \mathbb{B}(p \to \Box p) \Rightarrow \mathbb{B}p \end{array}}_{\mathbb{B}_{R}} \underbrace{ \begin{array}{c} \hline p, \mathbb{B}(p \to \Box p) \Rightarrow \mathbb{B}p \\ \hline p, \mathbb{B}(p \to \Box p) \Rightarrow \mathbb{B}p \end{array}}_{\mathbb{B}_{R}} \underbrace{ \begin{array}{c} \hline p, \mathbb{B}(p \to \Box p) \Rightarrow \mathbb{B}p \\ \hline p, \mathbb{B}(p \to \Box p) \Rightarrow \mathbb{B}p \end{array}}_{\mathbb{B}_{R}} \underbrace{ \begin{array}{c} \hline p, \mathbb{B}(p \to \Box p) \Rightarrow \mathbb{B}p \\ \hline p, \mathbb{B}(p \to \Box p) \Rightarrow \mathbb{B}p \end{array}}_{\mathbb{B}_{R}} \underbrace{ \begin{array}{c} \hline p, \mathbb{B}(p \to \Box p) \Rightarrow \mathbb{B}p \\ \hline p, \mathbb{B}(p \to \Box p) \Rightarrow \mathbb{B}p \end{array}}_{\mathbb{B}_{R}} \underbrace{ \begin{array}{c} \hline p, \mathbb{B}(p \to \Box p) \Rightarrow \mathbb{B}p \\ \hline p, \mathbb{B}(p \to \Box p) \Rightarrow \mathbb{B}p \end{array}}_{\mathbb{B}_{R}} \underbrace{ \begin{array}{c} \hline p, \mathbb{B}(p \to \Box p) \Rightarrow \mathbb{B}p \\ \hline p, \mathbb{B}(p \to \Box p) \Rightarrow \mathbb{B}p \end{array}}_{\mathbb{B}_{R}} \underbrace{ \begin{array}{c} \hline p, \mathbb{B}(p \to \Box p) \Rightarrow \mathbb{B}p \\ \hline p, \mathbb{B}(p \to \Box p) \Rightarrow \mathbb{B}p \end{array}}_{\mathbb{B}_{R}} \underbrace{ \begin{array}{c} \hline p, \mathbb{B}(p \to \Box p) \Rightarrow \mathbb{B}p \\ \hline p, \mathbb{B}(p \to \Box p) \Rightarrow \mathbb{B}p \end{array}}_{\mathbb{B}_{R}} \underbrace{ \begin{array}{c} \hline p, \mathbb{B}(p \to \Box p) \Rightarrow \mathbb{B}p \\ \hline p, \mathbb{B}(p \to \Box p) \Rightarrow \mathbb{B}p \end{array}}_{\mathbb{B}_{R}} \underbrace{ \begin{array}{c} \hline p, \mathbb{B}(p \to \Box p) \Rightarrow \mathbb{B}p \end{array}}_{\mathbb{B}_{R}} \underbrace{ \begin{array}{c} \hline p, \mathbb{B}(p \to \Box p) \Rightarrow \mathbb{B}p \end{array}}_{\mathbb{B}_{R}} \underbrace{ \begin{array}{c} \hline p, \mathbb{B}(p \to \Box p) \end{array}}_{\mathbb{B}_{R}} \underbrace{ \begin{array}{c} \hline p, \mathbb{B}(p \to \Box p) \end{array}}_{\mathbb{B}_{R}} \underbrace{ \begin{array}{c} \hline p, \mathbb{B}(p \to \Box p) \end{array}}_{\mathbb{B}_{R}} \underbrace{ \begin{array}{c} \hline p, \mathbb{B}(p \to \Box p) \end{array}}_{\mathbb{B}_{R}} \underbrace{ \begin{array}{c} \hline p, \mathbb{B}(p \to \Box p) \end{array}}_{\mathbb{B}_{R}} \underbrace{ \begin{array}{c} \hline p, \mathbb{B}(p \to \Box p) \end{array}}_{\mathbb{B}_{R}} \underbrace{ \begin{array}{c} \hline p, \mathbb{B}(p \to \Box p) \end{array}}_{\mathbb{B}_{R}} \underbrace{ \begin{array}{c} \hline p, \mathbb{B}(p \to \Box p) \end{array}}_{\mathbb{B}_{R}} \underbrace{ \begin{array}{c} \hline p, \mathbb{B}(p \to \Box p) \end{array}}_{\mathbb{B}_{R}} \underbrace{ \begin{array}{c} \hline p, \mathbb{B}(p \to \Box p) \end{array}}_{\mathbb{B}_{R}} \underbrace{ \begin{array}{c} \hline p, \mathbb{B}(p \to \Box p) \end{array}}_{\mathbb{B}_{R}} \underbrace{ \begin{array}{c} \hline p, \mathbb{B}(p \to \Box p) \end{array}}_{\mathbb{B}_{R}} \underbrace{ \begin{array}{c} \hline p, \mathbb{B}(p \to \Box p) \end{array}}_{\mathbb{B}_{R}} \underbrace{ \begin{array}{c} \hline p, \mathbb{B}(p \to \Box p) \end{array}}_{\mathbb{B}_{R}} \underbrace{ \begin{array}{c} \hline$$

An infinite branch β is said to be *good* if it contains a good trace τ .

Connections to automata theory

Let Σ_0 be the alphabet whose characters are *rule applications* in π , *e.g.*

$$\mathbb{B}_{R} \ \overline{\rho, \mathbb{B}(\rho \to \Box \rho) \Rightarrow \mathbb{B}\rho} \ \in \Sigma_{0}$$

The language containing precisely the good infinite branches of π is an ω -regular tree language over Σ_0 .

Connections to automata theory

Let Σ_0 be the alphabet whose characters are *rule applications* in π , *e.g.*

$$\mathbb{B}_R \ \overline{\rho, \mathbb{B}(\rho \to \Box \rho) \Rightarrow \mathbb{B}\rho} \ \in \Sigma_0$$

The language containing precisely the good infinite branches of π is an ω -regular tree language over Σ_0 .

Let Σ_1 be the ranked alphabet whose characters are rule applications in any proof of some fixed sequent *s*. The set of proofs of *s* is a regular infinite tree language over the alphabet Σ_1 .

Connections to automata theory

Let Σ_0 be the alphabet whose characters are *rule applications* in π , *e.g*

$$\mathbb{B}_R \ \overline{\rho, \mathbb{B}(\rho \to \Box \rho) \Rightarrow \mathbb{B}\rho} \ \in \Sigma_0$$

The language containing precisely the good infinite branches of π is an ω -regular tree language over Σ_0 .

Let Σ_1 be the ranked alphabet whose characters are rule applications in any proof of some fixed sequent *s*. The set of proofs of *s* is a regular infinite tree language over the alphabet Σ_1 .

Theorem (Rabin, 1969)

- 1. The emptiness problem for regular tree languages is decidable.
- 2. Every regular tree language contains a regular tree.

Corollary

- 1. The provability of s is decidable.
- 2. If s has a proof, then it has a cyclic proof.

Cyclic annotated proof systems

Main idea: encode the automata-theoretic trace management into the proofs.

$$\operatorname{iw}_{L} \frac{\operatorname{id} \frac{p \Rightarrow p}{p, \mathbb{B}(p \to \Box p) \Rightarrow p}{\underline{p}, \mathbb{B}(p \to \Box p) \Rightarrow p}}{\underline{p}, \mathbb{B}(p \to \Box p) \Rightarrow \underline{p}, \mathbb{B}(p)} \frac{\frac{p \Rightarrow p}{p \Rightarrow p, \underline{m}} \operatorname{iw}_{R}}{\underline{p, \underline{p}, \underline{m}(p \to \Box p) \Rightarrow \underline{p}, \mathbb{B}(p)}} \frac{\frac{p \Rightarrow p}{p \Rightarrow p, \underline{m}} \operatorname{iw}_{R}}{\underline{p, \underline{m}(p \to \Box p) \Rightarrow \underline{p}, \mathbb{B}(p \to \Box p) \Rightarrow \underline{p}, \mathbb{B}(p \to \Box p) \Rightarrow p, \underline{m}} \xrightarrow{p, \underline{m}(p \to \Box p) \Rightarrow \underline{p}, \underline{m}}}_{p, \underline{m}(p \to \Box p) \Rightarrow \underline{p}, \underline{m}(p \to \Box p) \Rightarrow \underline{p}, \underline{m}}} \underbrace{w_{L}}_{R}$$

Important features of annotated proof systems:

It suffices to check a condition between each companion and its leaf.

- Removing the annotations yields an ordinary cyclic proof.
- Every provable sequent has a concise proof.
- ▶ ...?

Concise proofs

Definition

An annotated proof is said to be concise if the first repeat on any branch is good.

Completeness via proof-search often directly yields concise proofs:

- Jungteerapanich (2010)
- Stirling (2014)

Game-theoretic methods do not:

- Enqvist (2020)
- Marti & Venema (2021)

and neither does the method of canonical models:

▶ JR (2021)

We prove, in an abstract setting capturing each of the above, that every infinitary annotated proof can be made concise.

Infinitary annotated proof systems

$$\operatorname{iw}_{L} \frac{\operatorname{id} \frac{p \Rightarrow p}{p, \mathbb{B}(p \to \Box p) \Rightarrow p}{\underline{p}, \mathbb{B}(p \to \Box p) \Rightarrow [\Box \mathbb{B}p]}}{p, \Box \mathbb{B}(p \to \Box p) \Rightarrow [\Box \mathbb{B}p]} \frac{p \Rightarrow p, \Box \mathbb{B}p}{p, \Box \mathbb{B}(p \to \Box p) \Rightarrow p, \Box \mathbb{B}p} \operatorname{iw}_{R}}{\frac{p, \Box p, \Box \mathbb{B}(p \to \Box p) \Rightarrow [\Box \mathbb{B}p]}{p, \Box p, \Box \mathbb{B}(p \to \Box p) \Rightarrow [\Box \mathbb{B}p]}} \frac{p, p \to D, \Box \mathbb{B}p}{p, \Box \mathbb{B}(p \to \Box p) \Rightarrow p, \Box \mathbb{B}p}} \xrightarrow{iw_{L}} \frac{p, \mathbb{B}(p \to \Box p) \Rightarrow [\Box \mathbb{B}p]}{p, \mathbb{B}(p \to \Box p) \Rightarrow [\Box \mathbb{B}p]} \mathbb{B}_{L}}$$

Abstract definition of an infinitary annotated proof system

More precisely, we say that an infinitary annotated proof system P for some ranked alphabet Σ consists of:

1. An equivalence relation \equiv on Σ .

2. A relation
$$R \subseteq \Sigma \times \Sigma^*$$
 such that:

2.1 If aRw, then length(w) = ar(a).

2.2 If aRw and w is componentwise \equiv -equivalent to w', then aRw'.

3. A subset G of Σ consisting of good words such that:

if $w_1 \cdot w_2 \cdot w_3 \in G$ and $w_2 \notin G$, then $w_1 \cdot w_3 \in G$.

4. A subset I of Σ^∞ consisting of good infinite words such that:

if $w_0 \cdot w_1 \cdot w_2 \cdots \in I$, then $w_n \in G$ for some $n \ge 0$.

Theorem

Let P be an infinitary annotated proof system and let T be a P-proof such that the set $\{I_T(u) : u \in T\}/\equiv$ is finite. Then there is a concise P-proof T' with an \equiv -equivalent root label.

Further questions

- How should the abstract definition be restricted to ensure that the unravelling of a cyclic annotated proof is an infinitary annotated proof?
- Given a set of good words, is there a canonical definition for the set of good infinite words? (I think yes)
- How does the size of cyclic proofs obtained in this way compare to those given by automata-theoretic methods?

Can we also get uniform proofs?

Thank you!
