Axioms

following list of axioms: It seems reasonable to postulate that any SWF should satisfy the

- (PAR) The SWF should satisfy the Pareto condition: if every individual prefers x over y, then so should society.
- $(\forall P \in \mathcal{P}^n)(\forall x, y \in A)[[(\forall i \in I)xP_iy] \to xPy]$
- (IIA) The SWF should satisfy independence of irrelevant alternatives: social preference of x over y should not be affected if individuals change their preferences over other alternatives. $(\forall P,P'\in\mathcal{P}^n)(\forall x,y\in A)[[(\forall i\in I)(xP_iy\leftrightarrow xP_i'y)]\to (xPy\leftrightarrow xP'y)]$
- (ND) The SWF should be non-dictatorial: no single individual should be able to impose a social preference ordering.

 $\neg(\exists i \in I)(\forall x, y \in A)(\forall P \in \mathcal{P}^n)[xP_iy \to xPy]$

Lecture 1

making, such as voting procedures or fair division protocols Social choice theory studies mechanisms for collective decision

highlighting computational aspects and applications of logic. presenting both classical work in social choice theory and This course will be an introduction to computational social choice,

Outline of this first lecture:

- A couple of introductory examples
- Arrow's Theorem, the classical result in social choice theory
- Overview of the COMSOC research area
- Outlook on what will happen during the rest of the course

Condorcet Paradox

In 1785 the Marquis de Condorcet noticed a problem ...

Agent 1: $A \succ B \succ C$

Agent 2: $B \succ C \succ$ À

Agent 3: C
ightarrow A
ightarrow \mathcal{B}

agents into a social preference ordering? How should we aggregate the individual preferences of these three

contest. This is known as the $Condorcet\ paradox$ should have $A \succ B$ and $B \succ C$ in the social preference ordering. And by transitivity also $A \succ C$. But C beats A in a pairwise A beats B and B beats C in pairwise contests. So probably we

Computational Social Choic

ESSLLI-2008

Setting

- Finite set of alternatives A.
- Finite set of individuals $I = \{1, \dots, n\}$.
- and we will try to find a social preference ordering P. Each individual i has an individual preference ordering P_i , The set of all such preference orderings is denoted \mathcal{P} . A preference ordering is a strict linear order on A
- ordering for each individual. A preference profile $\langle P_1, \dots, P_n \rangle \in \mathcal{P}^n$ consists of a preference
- A social welfare function (SWF) is a mapping from preference profiles to social preference orderings: it specifies what preferences society should adopt for any given situation.

The Result

that would simultaneously satisfy all of (PAR), (IIA) and (ND). **Theorem 1 (Arrow, 1951)** If |A| > 2, then there exists no SWF

Now for the proof ... the majority of individuals also be the socially preferred alternative odd number of individuals): simply let the alternative preferred by easy to find an SWF that satisfies all three axioms (at least for an Observe that if there are just two alternatives (|A|=2), then it is

Extremal Lemma

every individual, society must do the same. <u>Claim:</u> For any profile in which b is ranked either top or bottom by Assume (PAR) and (IIA) are satisfied. Let b be any alternative.

bottom by every individual, but not by society. <u>Proof:</u> Suppose otherwise; that is, suppose b is ranked either top or

- (1) Then aPb and bPc for distinct alternatives a,b,c and the social preference ordering P.
- (2) By (IIA), this continues to hold if we move every c above a for every individual, as doing so does not affect the extremal b.
- (3) By transitivity of P, we get aPc.
- (4) But by (PAR), we get cPa. Contradiction. \checkmark

Dictatorship: Case 1

The existence of i is guaranteed by our previous argument. Let i be the extremal pivotal individual (for alternative b)

alternatives a, c different from b. Claim: Individual i can dictate the social ordering with respect to any

<u>Proof:</u> Suppose i wants to place a above c.

rankings of a and c as they please. (that is, aP_ibP_ic), and (2) all the others can rearrange their relative Let Profile III be like Profile II, except that (1) i makes a its top choice

So by (IIA), the social rankings must coincide: aPb. Observe that in $Profile\ III$ all relative rankings for a,b are as in $Profile\ I.$

Also observe that in $Profile\ III$ all relative rankings for b,c are as in Profile II. So by (IIA), the social rankings must coincide: bPc.

By transitivity, we get aPc. By (IIA), this continues to hold if others change their relative ranking of alternatives other than a,c. \checkmark

Electing a Committee

further difficulty, this time of a computational nature. election winner may be less popular than some other candidate; manipulation may be encouraged by the voting rule \dots here is a We have already seen that voting can be rather complicated: the

Suppose we have to elect a committee (not just a single candidate):

- If there are k seats to be filled from a pool of m candidates, then there are $\binom{m}{k}$ possible outcomes
- For k=5 and m=12, for instance, that's 792 alternatives
- The domain of alternatives has a combinatorial structure

mechanism. What would be a reasonable form of balloting? preferences over all alternatives to the collective decision making It does not seem reasonable to ask voters to submit their full

Existence of an Extremal Pivotal Individual

ordering (for some profile). can move b from the bottom to the top of the social preference Fix some alternative b. We call an individual $extremal\ pivotal$ iff it

Claim: There exists an extremal pivotal individual.

bottom. By (PAR), so does society. <u>Proof:</u> Start with a profile where every individual puts b at the

Then let the individuals change their preferences one by one,

preference of a particular individual causes b to rise from the bottom to the top in the social ordering. \checkmark By the Extremal Lemma, there must be a point when the change in moving b from the bottom to the top.

occurred $Profile\ I,$ and the one just after the switch $Profile\ II$ Call the profile just before the switch in the social ordering

Dictatorship: Case

Let b and i be defined as before.

respect to b and any other alternative a. <u>Claim</u>: Individual i can also dictate the social ordering with

the relative social ordering of a and b (both different from c). a given alternative c, there must be an individual j that can dictate Proof: We can use a similar construction as before to show that for

situation, we get i=j. \checkmark ranking of a and b. As there can be at most one dictator in any But at least in $Profiles\ I$ and $II,\ i$ can dictate the relative social

This contradicts (ND), and Arrow's Theorem follows. So individual i will be a dictator for any two alternatives

Ulle Endrise

Computational Social Choice

can be broadly classified along two dimensions Computational social choice studies collective decision making, with an emphasis on computational aspects. Work in COMSOC

The kind of social choice problem studied, e.g.:

- aggregating individual preferences into a collective ordering
- electing a winner given individual preferences over candidates
- fairly dividing a cake given individual tastes

The kind computational technique employed, e.g.:

- complexity theory to understand limitations algorithm design to implement complex mechanisms
- $\bullet\,$ logical modelling to fully formalise intuitions

The next few slides are a collection of examples, followed by an overview of the rest of the course.

Ulle Endris

Computational Social Choic ESSLLI-2008

Mechanism Design

domains other than voting we can sometimes do better. We have seen that manipulation is a serious problem in voting. In

Suppose we want to sell a single item in an auction.

- First-price sealed-bid auction: each bidder submits an offer in a sealed envelope; highest bidder wins and pays what they offered
- Vickrey auction: each bidder submits an offer in a sealed envelope; highest bidder wins but pays second highest price

In the Vickrey auction each bidder has an incentive to submit their truthful valuation of the item!

W. Vickrey. Counterspeculation, Auctions, and Competitive Sealed Tenders. Journal of Finance 16(1):8-37, 1961.

Judgement Aggregation

aggregate. JA studies the aggregation of judgements on logically inter-connected propositions. Example: Preferences are not the only structures that we may wish to

collective judgement produced by the majority rule is not While each individual set of judgements is logically consistent, the

Ch. List and Ph. Pettit. Aggregating Sets of Judgments: Two Impossibility Results Compared. Synthese 140(1–2):207–235, 2004.

Efficiency and Fairness

we can distinguish two types of indicators of social welfare. When assessing the quality of an allocation (or any other decision)

Aspects of efficiency (not in the computational sense) include:

- $\bullet\,$ The chosen agreement should be such that there is no worse for any of the other agents ($Pareto\ optimality$). alternative agreement that would be better for some and not
- If preferences are quantitative, the sum of all payoffs should be as high as possible (utilitarianism).

Aspects of fairness include:

- The agent that is going to be worst off should be as well off as possible (egalitarianism).
- No agent should prefer to take the bundle allocated to one of its peers rather than keeping their own $(envy\mbox{-}freeness).$

How do we formalise this? How do we compute optimal solutions?

Logic and Computation

ESSLLI-2008

Computational Social Choic

- Much work in SCT is axiomatic (e.g. Arrow's Theorem). While the field is mathematically rigorous, it is not (yet!) formal.
- Some research is about aggregating structures of a logical nature: judgement aggregation, belief merging
- Tools from knowledge representation are useful for modelling preferences for social choice in combinatorial domains.

 \bullet In the long run it may become possible to specify social

- Some very involved social choice mechanisms require careful certain properties ("social software"). mechanisms in a suitable logic and to automatically verify
- algorithm design to become usable.
- Tools from complexity theory can help understand limitations and design mechanisms that are hard to manipulate.

Ulle Endris

Wednesday

Computational Social Choice

ESSLLI-2008

Computational Social Choice

alternatives to be decided upon have a combinatorial structure. Collective decision making can be particularly challenging when the

for and voting in combinatorial domains. On Wednesday we will discuss $preference\ representation\ languages$

- Overview of languages for representing both ordinal preference relations and utility functions (cardinal preference structures)
- Exemplification of properties such as expressivity, succinctness and complexity in the context of a specific language
- Approaches to voting in combinatorial domains: to what extent can we vote issue-by-issue?

(knowledge representation & reasoning) community. Much of this takes inspiration from work coming out of the KRR

Earth Observation Satellites

all requests can be honoured \dots photos to be taken by the EOS, but due to physical constraints not Observation Satellite (EOS). Now they are requesting certain European countries that have jointly funded a new Earth Suppose our individual agents are representatives of different

Allocations should be both efficient and fair:

- The satellite should not be underexploited.
- Each agent should get a return on investment that is at least roughly proportional to its financial contribution

M. Lemaître, G. Verfaillie, and N. Bataille. Exploiting a Common Property Resource under a Fairness Constraint: A Case Study. Proc. IJCAl-1999.

Collective Decision Making

- alternatives form a social point of view. preferences into a collective preference, i.e. a ranking of the Preference aggregation: aggregate a profile of individual
- we can also aggregate things other than preferences: $judgement\ aggregation,\ belief\ merging,\ \dots$
- Voting: select a winner (or a group of winners) given a profile of individual preferences over candidates.
- only care about the top choice in the collective preference could be seen as a preference aggregation problem, where we
- Fair division and resource allocation: select an allocation of goods to agents given their individual preferences.
- could be seen as a voting problem, but that would mean ignoring useful information (e.g. an agent will typically be indifferent between allocations giving it the same bundle)

Computational Social Choic ESSLLI-2008

Tuesday

Tuesday will be an introduction to voting theory, with some examples for applications of complexity theory in that area.

- Many different voting procedures, such as the plurality rule, the Borda count, approval voting, single transferable vote, \dots
- Discussion of properties ("axioms") we would like to see satisfied by a voting procedure
- May's Theorem and Gibbard-Satterthwaite Theorem
- Complexity as a barrier against manipulation: can we make it computationally intractable to manipulate a voting procedure?
- Other applications of complexity theory, e.g. analysis of the complexity of computing winners for complicated voting rules

Ulle Endriss

ESSLLI-2008

Thursday

On Thursday we will start discussing $fair\ division$, focusing on -cutting procedures for allocating a single divisible good

- $\bullet\,$ Notions of fairness: proportionality and envy-freeness
- Overview of classical cake-cutting procedures from the literature, highlighting open problems
- Complexity of cake-cutting: how many cuts do we need to make a fair division?
- Pointers to literature on logical modelling of fair division and similar problems ("social software")

Friday

On Friday we will start with an introduction to welfare economics, briefly look into some related complexity questions, and then study distributed mechanisms for fairly allocating indivisible goods.

- $\bullet\,$ Social welfare orderings and collective utility functions
- $\bullet\,$ Complexity of finding a socially optimal allocation
- \bullet Design of interaction protocols that permit convergence to socially optimal allocations in distributed mechanisms

Ulle Endriss 25

Literature

There are several textbooks on (classical) social choice theory in which you can find an exposition of Arrow's Theorem, for example:

• W. Gaertner. A Primer in Social Choice Theory. Oxford University Press, 2007.

For a tentative overview of the COMSOC research area, have a look at this survey paper:

• Y. Chevaleyre, U. Endriss, N. Maudet, and J. Lang. A Short Introduction to Computational Social Choice. SOFSEM-2007.
